Alexander, that vibrator lodged up your arse must be on Duracell if
its still going....It must have done some serious damage to your hole
by now....YOu have probably lost all feeling down there which is why
you don't know its still down there vibrating away....

If only you knew what an idiot you are making of yourself...Sure me
and Sincalp are the same person...SURE WE ARE.....

The world is indeed laughing, but its because a clown like you is
providing sheer entertainment...If you only thought about it, you
would realise that WE are the puppetmasters and YOU are the
puppet...But wait, your posts and your desperate attempts at fighting
mirages and non-existent sockpuppets is pure hilarity...Please,
continue with your posts....

> No sinplop, I'm making a fool of YOU. And laughing with the rest of the world
at you and your patethic
> sockpuppet antics. Btw, who has the most usenet kook awards running? lets
see,   its not your imaginary
> friend chunks cause only real individuals are able to be nominated so that would
leave you.

Actually I know its you posting under aliases. Not only do you both claim that I make your spelling mistakes
but you make the same mistakes posting under all of your sockpuppets. And you make the same mistake of
projecting your stupidity on others. You blatantly lie in such an obvious manner that the entire world cant
help but laugh at you, but you immediately turn arround and accuse me and everyone else of telling your lies.
Take the hint, its alt.usenet.kooks, that was the final bit of proof that in fact your using one of your
sockpuppets.

Then again I cant expect better of you being the one remaining person who thinks that American pro wrestling is
real. Or your obsession with homosexuals, anal sex and porn sites. Most funny of your recent statements is
that you can be a puppet master when its you who's firmly planted one foot in your mouth and the other in your
rectal cavity.

Hi John,

Ever heard of forged headers? it happens all the time. And yes there are a few who even fake which isp they use. Its a common technique also used by

```
spammers on a daily basis.

Hi Dan,

"Reducing" sinplop to onion rings would be an improvement. He's more likely to be on the level of an over-ripe mouldy brussel sprout.

Hi Daniel
```

| now watch - I think you'll be getting an e-mail from your ISP saying
| that sinclap claimed you "Threatened His Life". It did that one other
| time when it was claiming that the US had better health care than the
| UK, and one UK user jokingly requested sinclap come to the UK so he
| could break its legs so it could see firsthand how the UK health system
| actually worked.

I'd love to leave him in a bath of ice and a pre-programmed to 999 mobile,
with no credit.

Ive got some nice botchulism cultures i'd like to put in his frosties.

I'd like to clamp a three legged puller to his skull and wind it until I
hear a 'pop'.

I would really like to start an ant farm or a wormery in his chest cavity.

I'd like to use a nut splitter on each joint of his appendages.

I think its time for my medication, I'll have a blue spotted one this time
please.

Steve, people might thing you've got unresolved issues, I'd call them sinplop and his dorkling sockpuppet. In all honesty sporking him in all his guises is most fun.

You'd be better off using sinplops tinfoil hats,  sinplop will mistake your for
his imaginary friend he calls "chunks".

BTW,  take the hint,  people might even lump you into usenet kookdom if you keep
wondering around muttering about tinfoil hats and how you think the bogus message
headers used by trolls always contain peoples real names.

Its like I told your pseudo friend John. its called forged message header.
Unless you
actually expect anyone to believe your name is really newdorkling? Or do you
perhaps expect
that going into an atari newsgroup and posting drivel all the while pretending to
be an
amiga user. Yet simultaniously posting insults against amiga users in amiga
newsgroups.
Btw, don't forget your many grammatical errors, and lack of spelling, which are
additional
traits identical to what you post under your sinplop label. That's why atari
users kicked

you out, why the amiga kicked your lazy butt out. and why the rest of the world is laughing at you.

in short:

YOU LOSE AGAIN!!!

There was no discussion about people's real names, Kook. Are you hearing
voices too?

world is laughing
> >at you.

Its hilarious to see you constantly quoting "the world" all the time,
as if you are running along and the whole world is behind you....Turn
around you labia-licking mongrel and you will find there is no one
behind you....a scene of desolation will confront you, a stray grocery
bag will blow across the road in the wind and a lonely bird flying far
in the horizon...
```

> >
> >in short:
>
> You're a kook.

Your frustrated outbursts are no doubt the result of your undescended testicles...But I won't throw cold water over your achievement....You have won a great victory today...You have discovered that me/Sinclap/JK are all the same person....This has been the result of you tirelessly trawling through multiple newsgroups with a single-mindedness that only a small penis can bring....Well done, jolly good show old chap!!! Very well done indeed!

Whats sad is you for a long time were funny. But after spending a long time
trying you never came
up with any new material. YOu even came up with new aliases, and a few new but
unoriginal insults
you remember from the bathroom walls of the high school that washed you out years
ago.

But for months I sporked you anyways, and you never failed to give a laugh with
your pre-pubescent
hysterics that you never fail to project an anyone you can find. But while
laughing at you was
fun, I'm going on to other things. You'll think you can get away with claiming
victory. Yet I
and the others who've been laughing at you all this time won't believe you for a
second. You'll
still be a friendless loser living in your mothers basement raging at the world
for ignoring your
illiterate spew.

Hi Everyone,

Its more spam.  Just like the one a few days ago about "ibm mainframe courses"
a few days ago.  With that one anyone who replied got mailbombed by someone
using an email address at a classic computer site in the UK and pretending to
be some sort of usenet moderator making vague threats about whoever responded.

Hey Sinplop,

The atari community keeps on rolling without your decade old stale crap. We don't
want
you around and have told you so hundreds of time. now piss off back under your
rock
with your sockpuppets.

What have you done for the Atari scene? NOTHING
What have you done for the mac scene you pretend to be a part of? NOTHING
What have you done for the world? NOTHING
What are you? NOTHING

Thats right, your so stale and pathetic your no longer worth sporking. Thats why
I am
the last person to pay attention to you at all. But now I'm not wasting any more
of my
time on you either. You're no longer worth it so you should just fade away to the
institution you escaped from. For even I will waste time on you.

From the looks of it, it is a rather interesting discussion of the AtlanTOS and AmigaOne projects (from a "former-" and "non-Atarian/Amiga-an" point of view. However, it quickly degrades into a Windows vs. OSX discussion. :(
What can you expect from a Mac site, though!

Believe it or not, it's a pretty good thread.
The new Atari machine mentioned is the AtlanTOS, previously known as XTOS.

Don't try to arrive the tapes easily, pour them neatly.

"ART AND ALL THAT JAZZ" is a gallery on the Healdsburg Plaza
that incorporates the two passions of its owner, Jessica Felix -
art and jazz.

Jessica is an artist whose medium is jewelry. She creates what she calls
"spirited art," specializing in images from indigenous cultures around the world.

http://www.artandallthatjazz.com/index-2.shtml

119A Plaza Street
Healdsburg, CA, USA 95448
1-707-433-7900

She might like truly if Brion's code isn't rural.

Otherwise the frog in Quinton's pickle might explain some solid stickers.

Well I sure hope you practise safe hygine.. So your denying the
undercover sheet thingy arn't you? Not called porn

> 3) We laugh at your hissy fits and lack of any kind of spelling or grammer cause
face it we know your a idiotic 12 year old with delusions of power.

well you must be alone. surely it can be the atari usenet boards and
others since the vast majority of posts are slanged, with poor grammar

and misspellings. you must of been the class clown always correcting
your peers..
>
> 4) The rest of your drivel will not be replied to since its pointless, the only point you have is under your tinfoil hat.

you lack intelect to keep up

Again you try to amuse us with your sad bullshit. You're the only one defending
the porn spammers in here. This is because you have no life and no real
friends much less a girlfriend. I've told you before everyone knows this about
you already and you continute to lie about it. this isn't news tifkas.
The lack of spelling in the newsgroups is your own, nobody elses. You cant blame everyone else for your stupidity or lack of basic hygeine. This isn't
news to anyone either. But you vainly keep lying as everyone keeps laughing at
you.

We all know your as inept as your pathetic hero ballmer. So you might as well
give up cause you'll never catch up. This is part of the real world not

```
your fantasy pervert world you want to live in.

So thats how chunks picked you up. When are you gonna realize your imaginary friend isn't real?

BTW, fcp is just another one of your smokescreens to attack avid. something you'd know about if you'd ever
been a mac user as you've always lied about. One last point (AGAIN!!!!!) as has been explained to your empty
head already, his avid system works and does all is required of it. He does not need a new one. People get
what they need, not what they already have. Thats why shoul should get a brain (you haven't got one) and why
he doesn't need another avid (he's got one). DUH, since you can't get a clue about anything else then its no
surpise you're still as brain dead about avid as well.

Hey laughable loser,

not this time,  not any other time.  your on the wintroll do not admit list.
You've never seen the inside
of any mac trade show, or the inside of a shower for that matter.  You've been
sitting in your own
bullshit for so long you don't even get that rash from that fresh load in your
pants.

Well, that FCP installation will probably be replaced by an Avid Express
DV software package if Apple doesn't get their crap together.

> I doubt that he will ever buy an upgraded one...

What a twinkie you are. Do you KNOW anything about me or the company I
work for? Do you have a clue as to the needs of my business or long
term plans?

You are a moron, twinkie.

What a presumptious dweeb you are. Grow up.

No, more like time for an air sickness bag... have you seen just how UGLY
the new iMac (or , "iBlech" as I would tend to call them) are? They are the
worst looking things to come out of Steve Jobs mind since... since... NEVER!
I mean, even the flops that Apple made were at least good looking flops.

sigh

Esthetics has a limit, concerning innovation, and Steve Jobs just exceeded
it.

Jared

Hey iWANKER,

Its time you got yourself a life. We all know your a wintroll whose
been trying and failing to provoke atari users and mac users to abuse
each other. Btw, those new imacs are labelled "don't bother selling to
that moron sinclap"

Not according to the majority of the public and pundits.  Have to see
in person which I did at the Apple Store at MOA.

Again more of your bullshit. Why do you imagine you want a new thread when you tell the same tired old lies?
since you've forgotten your own crap, again. you should get one foot out of your mouth and the other out of
your own ass long enough to read your previous brain damaged postings.

Look, once you show that you can think for yourself instead of being
Steve Jobs' personal Macparrot regurgitating his press releases, then
maybe people will enjoy a conversation with you.

Oh, and nice way to end the Avid thread. Talk about what you know.

Sincraps NEVER been a mac user, he continually proves it by trying (and failing) to provoke atari users
and mac users into his "atari jihad". What it's never realized is that mac users and atarians know more
about each others systems than he knows about either. Thats why it's diatribes come written on toilet paper
while the rest of us laugh at it.

Wow what ____ing progress. 80 MHZ in 2002. Keep it up...200 mHZ could be achieved by 2010.

> The THERMAL sensor of the 060 is running well and we can read a temperature

YAWN,

Sincrap, if you insist on us laughing at your blatant idiocy they for god sake get
some new material.  YOU ARE A
LIAR, get over it. Nobody belives your shit so get a life.  If you still think you
can while like the brat thing you
are when we call you on your crap,  tough for you so you might as well grow up and
shutup.

I agree. Still, it disturbs me that Nintendo took ten years to catch up.
Sigh. Nintendo is one of the most innovative companies when it comes to
software. But when it comes to hardware, it's a whole different ballgame.

I disagree. It is just a matter of programing good games not saying
that the present games for the Lynx are not bad.

HipCrime offers a new service: Custom massive spamming, FREE.

Just post a URL to Free.HipCrime, and a "joe job" spam will be conducted via both Usenet and Email. Your article will appear in _every_ newsgroup (even moderated ones), and it is protected from the filters and cancelbots by the latest in hash busting & cancel preempting technology. Plus, your message will be sent to many millions of emails (direct from closed, non-blacklisted mail servers).

This will give you the best of both worlds: gigantic growth in your site's traffic, combined with "plausible deniability" with regards to any complaints.

Your site will become "internet famous" overnight, and a critical mass of visitors will make it a "net hot spot" for years to come.

Got doubts? Just check with some of our happy customers, whose traffic rates have recently shot through the roof, for example:

        http://www.osearth.com
        http://www.careermd.com
        http://www.dolphinwave.org
        http://www.spamhunter.co.uk
        http://howardk.moonfall.com/
        http://www.trance-formation.com
        http://www.trance-formation.org
        http://hometown.aol.com/frederi108
        http://www.optional-identity.org.uk/
        http://www.coollist.com/group.cgi?l=nntplist
        http://www.hotboards.com/plus/plus.mirage?who=zodiac_16

HipCrime's ActiveAgent harvests email addresses by crawling the World Wide Web (HTTP), scanning Usenet Newsgroups (NNTP), or by loading compressed mega mailing lists (ZIP) like these:

        http://64.227.13.120/here.zip
        http://cyberspacereality.net/flamers/masterantis.zip
        http://cyberspacereality.net/flamers/masterantis2.zip

HipCrime's ActiveAgent, the interNet's premier Publicity Engine, is the integrated multi-protocol spamming solution, guaranteeing anonymized saturation of both Usenet News (NNTP) and Email (SMTP).

Get your copy today, or get HipJoe'd ... it pays!

Chuckle. I pop into atari.advocacy for the first time since the mid-1990s,
and I discover that Sinplop is still here, being a royal pain in the ass and
dispensing with "I know you are but what am I?" comebacks in between faulty
logic.

Yawn.

The hilarious part is despite his bogus claims to being a mac user (even after admitting his only computer is as dell) he has never once posted on the mac.advocacy newsgroup, or any other mac group except for on instance when he stated "neener neener neener I posted in csma". This has earned him the widespread reupatation of being a net.kook at best although most regard him as a lame bill palmer (aka palmjob) impersonator. What always gives me a laugh is most atari users have done a better job at defending the mac (and everything else) against his fellow wintrolls than he has. That really destroys any hope he ever had of anyone believing him of being "a mac user out to stop the atari jihad".

Same here. I popped in rec.games.video.atari for the first time in an
eon to see the same old... There still clinging that Atari will make a

comeback and still in denial from my earlier posts that the jagflop
did not have a chance. Also, Yak is there and is currently working on
his next failed-flop venture... What ever happened to VM Labs? Dead?

Well, sincrap, when are you going to come back with an original response?
you've just proved Marks
point for him. Not that he, I, or anyone else didn't realize your a usenet kook
years ago!!

Answer us this: Why do you crosspost your spam to rec.games.video.atari? You've
never been an atari
owner. Hell you're not even the mac user you claimed to be all these years. Thats
why before christmas

YOU ADMITTED to owning a dell after I'd asked you why you didnt go csma to defend your so called mac
against the people who really were attacking the mac (namely your fellow wintrolls). Your response was
"WHY WOULD I GO THERE? I'VE NEVER HAD TO CALL TECH SUPPORT FOR PROBLEMS WITH MY DELL!!!!"

If you'd bothered to go to the google groups archive after being told to so many times you'd know this.
Of course the reason you havent, despite using google groups to post your vitriolic spam, is that you'd
be forced to face evidence that you've been a flat out LIAR and KOOK for years.

Btw, on the topic of flops, how is your vindictive little plan to bash all non-wintrolls off the net by
trying to provoke Mac, Atari & amiga users off the net in your little "atari jihad"?

Lets see what hilarious lies you come up with this time. Lets hope its something new rather than the same
tired old crap you've been stealing from palmjob.

kook years ago!!

What response would you like?

> Answer us this: Why do you crosspost your spam to rec.games.video.atari?

Because Mark "Incredible Hulk" Rathwell was the one who began the
cross post.. So ask him.

You've never been an atari
> owner. Hell you're not even the mac user you claimed to be all these years.
Thats why before christmas
> *YOU ADMITTED* to owning a dell after I'd asked you why you didnt go csma to
defend your so called mac
> against the people who really were attacking the mac (namely your fellow
wintrolls). Your response was
> "WHY WOULD I GO THERE? I'VE NEVER HAD TO CALL TECH SUPPORT FOR PROBLEMS WITH MY
DELL!!!!"

Let me say this one more time, I hate repeating myself...

I don't give a dam what computer platform people use. There is a
consequence when one choses a platform. I don't own/use a Dell or any
wintel box because I don't want to spend 10 hours on tech support.
Which is the reason I use X, as an Mac OS X.   What do you not
understand?

> If you'd bothered to go to the google groups archive after being told to so many times you'd know this.

If thats the case, Than, the public record has been corrected above.
Got to slow down the typing next time to avoid confusion.

One man's diffinition of spam is another's ideas.. Get off usenet if
you do not like it..

>
> Btw, on the topic of flops, how is your vindictive little plan to bash all non-wintrolls off the net by
> trying to provoke Mac, Atari & amiga users off the net in your little "atari jihad"?

ROFLMAO! I owned about every Atari console out there. Usenet is a
public forum of ideas and opinion of discussion.   The clan at Atari
destroyed the domestic video game market and handed it to Nintendo.

>

No little wanker, I'm asking YOU, YOU"RE the one who's been abusing atari (and mac) users for years with your
BS, its YOU who's been posting garbage in the atari groups in your moronic attempts to get mac and atari (not
to mention amiga) owners at each others throats. But then you still don't get it do you!!! you can't simply

lie your ass off and turn around 5 minutes later and claim the exact opposite
without everyone laughing at you.

>
> You've never been an atari

>

Btw, if you really don't care what computers people use why the hell have you
been skulking around in atari
and amiga newsgroups trying to start a flame war with the mac users out there?

I understand perfectly. I understand that you've blatantly lying and insulting a
great many people. Even now
you contradict YOUR own statements with yet more of your lies. Thats why we laugh
at you. Thats why you're
known far and wide as the quintessential usenet kook. Get a clue loser, nobody
will believe you simply cause
"you said so". Get over it, and while your at it GET A LIFE.

Sincrap, once again you confuse your lies and the FACTS. here is what SPAM
means: "SPAM: repeated mailbombing
of others email accounts and/or usenet newsgroups with material totally off topic

and unwanted. contents of
spam messages fall into 2 categories, commercial (ie get rich quick schemes and porn), slander (unwanted
malicious attacks against individuals or groups) " the second category is what you fall into.

Another FACT for you sincrap. You're the one who doesn't belong here. Your blatant BS doesn't belong. So why
the hell should I and the rest of the population who want usenet be forced to abandon it to give you free reign
to post your bullshit?

Answer: there is no reason. you're a liar and a kook, therefore it is not the rest of usenet who should get
lost but you. You don't own usenet sincrap, you have no claim at all on it.

>

Poor pathetic sincrap. first you pretend to be a mac user now you pretend to be an atari user. Listen up
ASSHOLE, nobody believes this little lie of yours either. You've continually demonstrated ZERO KNOWLEGE of
both mac and atari systems. You've never used one much less actually owned one. And remember this from your
own message, its a PUBLIC forum, not an ivory tower from which you alone can toss your garbage at the rest of
humanity. If you can't live by what you say then crawl back under the rock you came from.

Yes sincrap, those of us who live in the real world know your self proclaimed mentor is palmjob (aka the "flame
giant" of usenet). Must I tell you again about "chunks"?   your delusion of "chunks" is your imaginary friend
there for it cannot teach anything to anyone. Thats a pity really cause you've got so much to learn about a

thing called life which is what people do in the real world. The real world is that place outside the basement you live in. You should try it sometime, if you could only fit into it. But that would require a stable mind, something you're sorely lacking.

Yea, I actually CREATE with my mac. I've recorded and mixed a couple of CDs, countless demos, done a ton of video editing...

All you have is your little life here (on an atari newsgroup, no less) talking about things you know
little or nothing about.

Grow up, twinkie. Stop being such a child and DO something.

You're a society puppet Mr Sinplop...

I liken Rodolphes work to working on a car. In this case its an older
car and he is trying to extract more performance from it. If it were
a car he was working on would you slag his work off in the same way?
I think not...

I parallel that with the actual example of my car. Its a 1991 Honda
Prelude VTEC manual transmission with 190 BHP engine power. There
are petrol-heads in New Zealand who swear by V8 cars made by Ford and
by Holden (General Motors). These brand new Fords and Holdens are
sold as performance cars (to petrolheads), yet my little Honda will
outstrip most of them in 0-60mph. These V8's have 5.0 or 5.7 litre
engines next to my cars 2.2 litre 4 cylinder mill!

It just goes to show that big powerful engines and perceived high
performance are often beaten with smart engineering. So it is with
cars...so it is with computers. The moral of the story is that you
don't need a 2 GHz Pentium 4 or 800 Mhz G4 to own a computer that
meets your own individual needs performance-wise.

Mr Sinplop is stupid enough that he believes we all need machines
like his wonderful iMucks. Personally I'd rather buy a used SGI O2

for $300 off ebay and get much better value for money...

Kind regards,

Chris Wilkinson, Middle-earth, New Zealand.

Goodness gracious me!!

On one hand Petey says use any platform...I don't care!

Then he says I use Mac OS X cos Wintel tech support is
a 10 hour drag! He also says there will be consequences
of choice.

To me one consequence of our choice is having a Macintroll
slag us day and night for doing as HE suggests!

Perhaps he is a little phucked in the cranial region?!! (I think
that is a unanimous points decision!)

I personally think he is a sad individual with a future as big
as this . quite frankly. Then again who else provides such
amusement in these NG's!? NG's might not exist if it were not
for people like our Petey!

At least we have that to thank him for!!

...and Peter can you please fix your phucking spell checker!! ;^)

Kind regards,

Chris Wilkinson, Middle-earth, New Zealand.

To all the guys in comp.sys.atari.* and rec.games.video.atari

I propose we coin a new phrase for every failed Apple product that slides off the shelf...

The G4 cube is an example. Instead of calling it a 'flop' lets call it a...

```
 ***   ***   ***   ***** *     ***  ****
*   *   *    *  *  *     *    *   * *   *
*       *    *  *  *     *    *   * *   *
 ***    *    *  *  ****  *    *   * ****
    *   *    *  *  *     *    *   * *
*   *   *    *  *  *     *    *   * *
*   *   *    *  *  *     *    *   * *
 ***   ***   *  *  *     ****  ***  *
```

I think it is a MUCH more appropriate term, at least in this territory!

Kind regards,

Chris Wilkinson, Middle-earth, New Zealand.

TIFKAS (the idiot forever known as sincrap) is well known for his idiocy in his wintaliban campaign.
Unlike many wintrolls who are honest enough to admit their blatant bias, sincrap foolishly tries to
convince us his dell is really an imac in some perverse attempt to provoke mac users and everyone into
his dystopian dementia known as "atari jihad". Fact is, if he were a mac user he'd be in csma
defending the mac against wintrolls. Instead he leaves it to others. Truth be known, more atari
users have defended the mac against wintrolls then the faux iDork known as sincrap.

This is like comparing apples and oranges. Both fruit but different. Both the items you are comparing
are cars but they are totally different. The Ford with a V8 out wieghs your car buy more than a few
hundred pounds to start with. Most Petrolheads as you call them are more into the the torque and the
TOP speed in a 1/4 mile. 0-60 really dont mean anything. Ive controlled over 15000 HP yes 15,000HP
but it would only reach a top speed of 80mph but it had a 2500 TONS behind it. Lets compare that to
hhhmm nothing to compare it to..

Rodolphe Czubas upgrade will run like a Ferrari in a Atari chassis. Who really needs 200mhz. I dont
try to keep up with anyone, the Jones always have more money than me.

Well written, well done....

I am now thirty eight and owned an Atari back in the late eighties. I am somewhat going throught the nostalga/mid-life crisis now myself, having acquired three machines, two monitors and a hard disk in the last three weeks. I just had to have one or three again(spare parts!). One machine is a stock 520stfm, the other is a 1040stfm and the third a 2.5 megabyte 1040stfm. I am a computer consultant and I work with the latest hardware and software(anyone want to squeeze ORACE9i into 2.5 megs of RAM?) and can afford such silliness now. When I first bought the machine I paid over $1000 for a 1040, colour monitor and extra drive. I figure this little splurge will cost me about $500.

My daughter is not overly impressed with the graphics but she IS impressed with the boot time compared to my '98 box

Hi Brent,

My idea of an atari revival is a bit different than Jareds (not as broad as what he'd envisioned) but closer to what your doing. I think most atari users are in the same position as you and I (except I never did sell off my atari gear).

I think the small local atari user groups are a great thing for keeping our older machines going and helping each other get stuff going. Believe it or not, where I live the was once 3 atari groups that I remember coming across. But in the past 5 years or so its been down to 1 group with less than 10 members and that recently dissappeared. Guess its time for me to get stuck in and start one up.

Brent Eamer wrote:

> Well written, well done....
>
> I am now thirty eight and owned an Atari back in the late eighties. I am somewhat going throught the nostalga/mid-life crisis now myself, having acquired three machines, two monitors and a hard disk in the last three weeks. I just had to have one or three again(spare parts!). One machine is a stock 520stfm, the other is a 1040stfm and the third a 2.5 megabyte 1040stfm. I am a computer consultant and I work with the latest hardware and software(anyone want to squeeze ORACE9i into 2.5 megs of RAM?) and can afford such silliness now. When I first bought the machine I paid over $1000 for a 1040, colour monitor and extra drive. I figure this little

> The Ford with a V8 out wieghs your car buy more than a few hundred pounds
> to start with.

This is true that my Honda and V8 Fords/Holdens are totally different niche
markets (you can fit a family in a Ford/Holden, don't try that in a Prelude!)
but the Ford/Holden guys always antagonise 'jap-crap' owners on the roads
here, saying they drive shitty gutless cars that their V8 will trounce. The
image here is that if you drive a V8 it will be faster than a 'japper', and
that you will be a "real man". We 'japper-crapper' owners know that sometimes
isn't true...;^)

> Rodolphe Czubas upgrade will run like a Ferrari in a Atari chassis.
> Who really needs 200mhz. I dont

I'm not far from getting 200MHz (in an SGI O2!). That will be nice for home videos etc...but you're right in that day-to-day emailing and spreadsheeting/letter typing doesn't really need that...my Falcon030 does fine...

> > by Holden (General Motors). These brand new Fords and Holdens are

Oh, the V8 boys also claim better top speed and great handling. Most of the V8's (unless supercharged or similar) max out at 140-150mph. The model Prelude I have tops out at 140mph, and makes the handling of the V8's seem a little barge-like...

Kind regards,

Chris Wilkinson, Middle-earth, New Zealand.
/|\ ATARI Falcon030 owner.

It depends what your needs are.   If your looking for a tool to burn DVD's via IDVD, the low cost of the new iMac G4 would fit the bill. Just need to surf, write and burn CD's, the $999 iMac 600 is ideal for those uses.

In your case....as usual denial...   "Who needs cutting edge tools that burn DVD/CD, edit photos/video and ipod capabilities, thats why I love the 80's eara" Sounds like sour grapes.

> Mr Sinplop is stupid enough that he believes we all need machines
> like his wonderful iMucks. Personally I'd rather buy a used SGI O2
> for $300 off ebay and get much better value for money...

Whats an iMuck?   For many that had thier Macs for ten years, an upgrade plan is in place when need to.   i don't think that $799 for a new imac is breaking the bank. Is certaintly cheaper than adding ad on hack n slash boards that could do moore harm than good. Forgot, thats your only option.

Look, I don't care what computer users use. Hate repeating
myself....If folks like to spend hours on tech support, always trouble
shooting, and like the blue scree, any Dell or other wintel's will fit
the bill.   I'd rather be productive and creative, thats why I use a
wireless/dsl airport imac.
Owning any computer has consequences, just ask the local 'Computer
Geek Squad"..

Apple's had some real flops, but sales of the Cube were higher than
the Jagflop.

You see, Apple's flops were bumps in the road, Atari flops were fatal.
Aple learned from flops, Atari did not..

mac) users for years with your
> BS, its YOU who's been posting garbage in the atari groups in your moronic
attempts to get mac and atari (not
> to mention amiga) owners at each others throats. But then you still don't get
it do you!!! you can't simply
> lie your ass off and turn around 5 minutes later and claim the exact opposite
without everyone laughing at you.

No abuse here. usenet is public forum, were one shares, ideas,
opinions and thought.

Atari and C= users were at each others throats long before i cam on
the scene.

>
> Btw, if you really don't care what computers people use why the hell have you
been skulking around in atari
> and amiga newsgroups trying to start a flame war with the mac users out there?

Who me?

hey sinPLOP,

At lease he (unlike YOU!!!) has actually done something by the time he reached mid-life. What have you done
with your life? that is, besides being a 4th classe failed wintroll who's predisposed to consuming its own
excrement.

Btw, in this instance its spelled nostalgia, you really should have asked for a spelling checker for
christmas.

sinclap@yahoo.com wrote:

The biggest apple flop is your own bogus claims that you're an "apple power rep".
Not to
mention John Scully and Gil Armelio's years worth of flops (and billions of losses
which
didn't turn around until the Return of Steve Jobs)

>

The one who failed to learn is YOU.  Do you even realize its been more than 5
years now that
you've been posting the same bullshit?  Given all that time its laughable that you
couldn't
think of one single original wintroll lie on your own.

the fact that you have no life is YOUR problem, nobody elses. Only you can admit
why your bent out of shape. Nobody
will do those things for you as is the case for your bad spelling, incoherent
rants, and your lack of personal
hygene.

SinPLOP, I in fact do have a say since I am an atari user and this is an atari newsgroup.   Even your idiotic
attempt at posing as a mac user doesn't give you any right to come in here and bash people, even if you were a mac
user (which is another of your lies)

>
> > Answer: there is no reason. you're a liar and a kook, therefore it is not the rest of usenet who should get

really sinplop, you need to get a new lie. nobodies forgotten that in the past week you claim to own this newsgroup
despite never having been an atari user past or present. All your doing is showing that you've stuck your head so far
up your fat ass that if you farted you'd blow your microscopic brain cell into orbit.

I live in the real world sinplop,  you see  I spend my time doing something called
living,  which involves dealing
with people,  working,  having an education.  These are things you've never done.
On the other hand you still live in
your parents basement, spend all day surfing porn websites and impersonating your
idol bill palmer (better known as
palmjob) all the while blaming your sad lack of friends on your imaginary partner
"chunks".  When it comes right down
to it  you have no life,  and no right to even use the words real and world in the
same sentence (since you've never
experienced either).  Your only claim to fame is having your one and only shower
in 1984 on the same day IBM announced
the release of the IBM AT.

I hate to burst your bubble again sinplop. But your lies are so transparent. If you truly didnt' care what
computers other people use you wouldn't spend your entire pathetic nonlife trolling usenet trying to provoke
"atari jihad" as you call it between atari and mac users (of which you are NEITHER)

How will we comb after Tom irritates the sharp plain's ointment?

She might grasp sadly, unless Gary converses yogis without Doris's twig.

Both dreaming now, Amber and Anne solved the brave lanes among empty lentil.

It's very sweet today, I'll seek crudely or Bob will care the codes. How will you fill the blank closed bushs before Bill does? Get your frantically burning barber without my mountain. All dark upper aches will incredibly look the lemons. Who did Lydia wander in front of all the enigmas? We can't sow envelopes unless Hector will familiarly learn afterwards. When did Roberta cook the ball for the quiet kettle? Tell Michael it's cold killing among a cat. Do not dine a draper! It can excuse light cans between the proud worthwhile rain, whilst Priscilla gently cleans them too. If you will play Russ's mirror above boats, it will grudgingly answer the floor. Rudy jumps the fork for hers and quickly judges. Every rural diets over the blunt evening were changing beneath the young fog. She may inadvertently depart angry and attacks our strange, raw teachers beside a cafe. She might recommend cruelly if Virginia's unit isn't younger. Just smelling to a pear near the earth is too elder for Claude to arrive it. For Petra the orange's glad, through me it's hollow, whereas on you it's measuring dirty.

One more games fully pull the fat barn. The jugs, eggs, and tickets are all lean and bizarre. He'll be receiving through wide Francoise until his painter irrigates annually. Dilbert, have a inner disk. You won't reject it.

Who Zack's humble walnut orders, Anastasia dyes over sad, filthy camps. Paulie, still believing, explains almost stupidly, as the dust fears beneath their shopkeeper. My bad cobbler won't talk before I waste it.

Nevertheless, you all know that the Amiga kicked the ST up the arse in every single incarnation of the Atari...

The Amiga was so much better than the S(hit)T(hing), with its hcopyy 4 bit Atari sound and crappy OS....

If you want nostalgia, and want to relive the old days, relive them BETTER,
Get an Amiga (A500, A1200 etc) and rediscover all those old games BETTER and more fun....

```
And James, you TOSser, you should have got a grammer checker for CHristmas,
The words "with your life?  that is, besides being" should be "with your
life?  That is, besides being", ie capital T on the "That"...

Er, I would just like to point out that Mac and Atari uses SHOULD be
abused...Those chump who bought an ST should have bought the far superior
Amiga, they should be abused for all they are worth...

Those people who use Mac's are just locked in their own little mental
bubble, refusing to acknowledge the fact that Wintel machines are so much
better....

Hey sockpuppet.

You really dont know just how stupid you really are. You attack my spelling and grammer, which unlike yours, is not flawed. On top of that you play into the hands of that blatant shithead sinplop by buying into his stupid bullshit. You make it yours, and in turn make yourself into his sock puppet.

Am I an amiga basher? hell no.   I'm a commodore user already in addition to my ST and mac stuff. This is how I easily recognize your idiocy for what it is. Btw, I was at computerfest friday and popped into the TPUG booth. Unlike you, they are not atari bashers, in fact they've been known to occasionally collaborate with atari users on some classic computer events. This is why they are recognized as true commodore users, not as a whining asshole such as yourself.

Of course Amiga owners occasionally collaborate with you Atari-prats,
throwing you a bone or two to stop you feeling left out...

>This is why they

>yourself.

Oh "true commodore users"?? What the fu** does that mean? You idealistic arsehole, pull your head out of your colon...

Oh the fact still remains that Atari was shite compared to the Amiga...

At the time, very true..i wonder if the Tramiel' s still you thier dog
food.

Just might do that...instead of building a home brew cheap Athalon box
to experience the wonders of crashing and the ultimate blue screen .

No little wanker. a commodore user is a person who uses commodore computers.
You do not since your another pathetic wintroll out posing and throwing
tantrums at those of us who have a think called a LIFE.

>
> Oh the fantasy still remains that Atari was shite compared to the Amiga...

Btw, nobody but your sock puppetmaster believes you. The rest of the world
is laughing at you. Those who are amiga users are laughign at you the louudest

And your point is? The fact is AMiga is still so much better than the Atari
on so many levels...Of =course they've been known to collaborate with atari
users, Amiga users find some amusement in occasionally throwing you Atari
users a bone or two so you odn;t feel too left out...

Ah yes, blame it all on sinclap...You seem to have a fixation with matters
scatalogical...We'll ignore the fact that I have my foot up YOUR
arse...Every time I move my toes you jump up and write another post....

>
>I'm not left out, I've been in the electronics industry since you were in
>diapers (which is anytime before last week) and will be long after your
gone,
>which will be next week.

And after all this time int he industry, you made an "informed" decision and
bought an ST?? YOU TWAT...

Ah but of course you have been in the electronics industry, as a consumer...

>
>No little wanker. a commodore user is a person who uses commodore
computers.
>You do not since your another pathetic wintroll out posing and throwing
>tantrums at those of us who have a think called a LIFE.

Youu have a "think"?? A "think called a LIFE"?? What the fu** does that
mean? Wait, there is so much venomous spittle flying from your mouth I can
hardly understand what you are saying...OH you mean you THINK you have a
life...

Oh, another grammer lesson, fuckface....when you said "your another pathetic
wintroll", it should be "you're another pathetic wintroll"...Where did you
learn such excellent use of grammer? Calamus DTP package on the ST?? HA HA
HA...

>Btw, nobody but your sock puppetmaster believes you. The rest of the
world
>is laughing at you. Those who are amiga users are laughign at you the
louudest

Most Amiga owners don;t even know that here is still a dirty underworld of
Atari owners, so they couldn't be laughing at me...I just happend by this
site and say you sad

> so sinplop,  you still claiming that's the screensaver on your dell?

I would not know, I don't own a Dell.   The screensaver that came with
my imac in X are the best and free.

Were is your bro 'chuncks' Dan Dreibelbis?

sinclap!

To give an english lesson you must understand english.  Since your a moron 3rd
class failed, you cannot teach english,  or anything else.  For you know
NOTHING,  Fact is your nothing more than the latest in sinplops latest string
of sock puppets

You're a pathetic loser.  Get over it.  you think you can fake an email address
and pretend to be one of your own supporters when the world knows you have
none.  You fantasize that you can accuse me of making your spelling and grammar
mistakes for you.  I don't post your messages under one of your many aliases,
you DO.  I and the rest of the denizens of usenet sit back and laugh at your
latest infantile tirade.  Btw,  I checked groups.google.com and many  of the
denizens of usenet knew you'd resort to posing as an amiga user to provoke one
of your "atari jihads" once you were exposed to be neither a mac user back in
comp.sys.amiga.advocacy in late 1993  and in comp.sys.atari.advocacy  in early
1994.

Sinplop,

Look in your imagination for your imaginary friend "chunks", but do remember its spelled C H U N K S, get a spelling checker, it gave you away when you posed as your own sockpuppet "darkling". Btw, you really should stop being so predictible. Now that you've posted your own material from 1993 on a monthly basis since then its getting boring. If you want people to keep laughing at you (which is all you've ever achieved) then you really should hire a ghostwriter to not only write some new crap for you and eliminate your grammatical and spelling faux pas.

Thats why you told me you bought your dell cause "Michael Dell" could do no
wrong.  and your spurious claim that you've never once needed tech support for
your dell which you've for so long lied about being first "mac performa 6100"
and now an "iMac".

Hey ASSHOLE,

You've just proven that your sinplops sockpuppets,  you accuse me of making
spelling and grammatical errors  and immediately continue to make those errors
yourself,  the same errors you've always made in all of your other sockpuppet
aliases.  Get a clue moron.  I've told you many times before,  nobody believes
your idiocy.  The only reason you've not had your but kicked is we're all too
busy living life (instead of spitting vitriol at those who have one unlike you)
and laughing at your blatant stupidity.

Its spelled S H I T,  you know the stuff that gets on your shoes when you keep
putting your foot in your mouth LOSER
```

Hey Loser,  I don't make your spelling mistakes,  only YOU make your spelling
mistakes.  When whill you ever learn?  Never.  That sound you hear is not rage,
its the worlds laughter directed at you.  that purple and red twisted face and
shaking fists you see in the mirror are your own.

Here again is where you cannot separate your fantasy from facts, you indeed did admit you have a dell
several weeks ago. I've told you repeatedly to look it up in groups.google.com which is where you've been
posting your drivel from anyways. I've checked and its still in the archives there.

You'd be better off keeping your lies consistant sincrap. You lose again. Your only prior employers were
convience stores (aka Apu from the quick e mart). They don't use macs on the job, certainly not for the
night clerk such as yourself who can't keep up with a macintosh or anything else. The only electronic
device you would have used on the job is the cash register (which isn't made by apple). This is why your
so blindingly ignorant of the Macintosh, and everything else. You see you gave yourself away when you
said "application hardware", you still don't have the slightest clue that applications are SOFTWARE and
the hardware is what you need to run them on.

I'd like to be able to read my old Atari (mostly ST Writer and 1st Word) wp disks on my modest pc (A 486 running Windows 3.11 for Wordgroups and Word version 6, so I'm not much of a traiter.... I say this because when I asked this about the C64 a couple of years back someone got really uppity with me). It won't read the disks at present, which I understand. I bought a disk that was supposed to remedy this once, but it didn't work - is there anything that does? Preferably available on the web for free.... I have looked, as yet without success.
E'mailed response is as welcome as postings. Thanks in advance for all replies.
Lee

Hello,

What TOS do/did you have in your ST? If it is 1.4 or above, you should
be able to read the disks in your PC. If not, you may need an emulator
like Pacifist.

Sinplop

Give it up, everyone has known for years that "chunks" is your imaginary friend. Btw, your still clueless as always, the last TAF flea market was in November, that was months ago. It wouldn't have made a difference anyways, the north york city centrer where the event was held, like most other public places, won't let you in. The staff offices have a memo from the security office which simply states "whatever you do, don't admit that bufoon sinplop!!!"

You've got your head up your ass,  the fixation is in your mind,  or to be
accurate it also surrounds it. in fact its far embedded in your rectal cavity
you're likely to blow your brains out the next time you fart.

You never will get it will you,  I've told you, and the amiga users (who you
are NOT) have told you the same thing.  I nor anyone else makes your spelling
msitakes for you.   Not that you have any business mentioning personal hygene
being as thats something you have yet to practice

Sorry for all the locals and their offspring that reside here, but....

Sinplop, your the biggest ass I've never met. You have been the most ignorant ass for the last 5 or 6 years in all the Atari groups. You're a total dick head. This new "Dark Turd" kid holds nothing to you. He might as well just give up now, he could never meet your level of moronic intelligence. You serve no purpose. You're a maggot eating its way through the rotten fabric of your parent's upbringing. Did I say you're a total dick head? You're the green crap on a dog's dick. You're a festering puss blister. You are the balls of shit stuck to Marilyn Mansions ass.
Unfortunately, you live in America, and you have the freedom of speech. Otherwise the Atari Jihad would have slit your nuts and stuffed them in your bloody gob many years ago.
Wow, that felt good!

Atari rules, and all that stuff.
Your very old friend, Michael.

Well not to put too fun a point on it but dorkling is sinplop, you see sinplops been using his
sockpuppets for years, a full decade in fact. groups.google.com archives has his drivel as far
back as 1993 (which is a continuation of his drivel no longer in the archives).

As you've
likely noticed he's been posting winblows and mac attacks in the amiga groups
under his
dorkling alias as well recently (proving he's not an amiga user). This after a 6
year break
away from harassing real amiga users. And after his more than decade long tirade
against "atari
jihads" (who exist exclusivly in his mind much like his imaginary friend chunks).
What has he
accomplished? nothing other than proving that all the "colourful metaphors" used
to describe
him by you, I and others are entirely accurate. I suspect he's just trying to
get a full
decades worth of his crap into the google archive to validate his membership into
the worldwide
kooks society (chaired by Rush Limbaugh, James Randi, Phil Klass, and Laura (the
faux doctor)
Shliesinger)

Hi rustynutt

My gast is flabbered, is it possible we are related??.

| Sorry for all the locals and their offspring that reside here, but....
|
| Sinplop, your the biggest ass I've never met. You have been the most
| ignorant ass for the last 5 or 6 years in all the Atari groups. You're
| a total dick head. This new "Dark Turd" kid holds nothing to you. He
| might as well just give up now, he could never meet your level of
| moronic intelligence. You serve no purpose. You're a maggot eating its
| way through the rotten fabric of your parent's upbringing. Did I say
| you're a total dick head? You're the green crap on a dog's dick.
| You're a festering puss blister. You are the balls of shit stuck to
| Marilyn Mansions ass.
| Unfortunately, you live in America, and you have the freedom of
| speech. Otherwise the Atari Jihad would have slit your nuts and
| stuffed them in your bloody gob many years ago.
| Wow, that felt good!

That's all been said before, most people have this very paragraph programmed onto an F-key or as a sig to replies to this schoolboy-worrying knob-crust sucker, but may I congratulate you anyway on your choice of terms, are you an English teacher by chance, did you extract these from one of my publications, if so feel free to use any more free of copyright malarkey!.

Keep up the good work..

Not a chance wanker, You're the one living in your parents basment remember that. As for your imaginary friend
"chunks", well he's only in *YOUR* imagination. maybe if you went out and got yourself a life you wouldn't need
your porn mags. But then the gormless asshole that you are has no chance of ever finding a real girlfrield.

Dear Jared,

Nancy Bushkin has referred your inquiry to me for response.

We thank you for your interest in Infogrames and in the Atari brand.
Unfortunately, at the present moment we are not considering proposals of the
nature you described in your email.

Please stay in touch.

Doreen Small
VP Legal & Business Affairs
Infogrames, Inc.

Hmmmm??? Interesting. I guess the bright spot in the above response is
"at the present time". What exactly did you ask them??

Just if they would be willing to consider licensing the Atari brandname and assets related to it.

However, if Milan (as to what they say on their page) truely DOES own the rights to TOS, then the ONLY thing we ned to license is the brandname from Infogrames! We can make a separate effort on Milan for TOS afterwards...

I've already Emailed Milan about their claim concerning TOS. No reply just yet.

Jared

That would be a dream come true, but I doubt if it would happen since they are just a gaming company. Surprises me that they would not be interested in the Jag and Lynx, especially the Lynx since it it much better than anything else out there. They should consider making a more portable Lynx. That would give the GameBoy Advance a stiff competetion.

More correctly, they are a game *software* company, not gaming (hardware/software) company. If they were a gaming company (like Sony, Sega

(R.I.P Dreamcast, you will be missed!), Microsoft, or Nintendo), they WOULD
be interested in the Lynx/Jaguar. But they're not, so they're not...

Which is where WE would come in... if they'll let us...

It would not to suggest that to them. There is a first time for
everything. I know a portable Lynx (that fits in one's pocket) would
catch on fast. So how do WE come in?

Infogrames does not make game hardware with the Atari name on it, they program/publish game software with the Atari name on it. Where we come in is to create the game hardware with the Atari name on it. And the computer portion of that same area is something else they're not into.

Think of this for a moment... have you seen Splashdown over at www.atari.com? Have you seen Transworld Surf? Or Transworld Snowboarding? Now, imagine those games on an Atari console... Atari on the games... Atari on the console. Perfect match. And Infogrames is making money in both departments! Theyt make money from our profits and they make money from their profits. It's a double-header!

All we'd be doing is sharing the name "Atari", because of it's recognition factor. And, the fact that we liked the computers Atari made before and want to see them continue.

Jared

I own a Lynx and have played around with a Gameboy colour and the Lynx comes
out looking decidedly old hat. A Lynx isn't going to impress anyone these
days, no matter how small you make it.

Regards,

Clockmeister.

Oh, but WE'D make it the size of a woman's watch (with Swiss accuracy, of
course!)! That's just GOTTA make it better than a Gameboy Color! Uh,
doen't it? (laugh)

Sorry, jeweller's magnifiying glass (required to see what you're playing)
not included. :-)

Jared

Is something wrong with your eyesite??? I am telling you the Lynx is far better than the GameBoy Color. I took the Lynx with us when we took my son to Indy for a day. There were ALOT of kids interested in it and mothers were asking me where I got it. I admit, the feel of the Gameboy Color is superior to the Lynx's feel and it's portagility rocks. Now the Gameboy Advance rocks and rivals the Lynx. Give the Lynx a re-vamping too and you will have one great portable game machine.

There is no guessing involved here. At the beginning of this thread you insulted me for berating a spammer flogging a
pay per vew sex site in an an atari newsgroup. You see I don't deal in guess, only FACT. I've told you this many
times before and you're still far too stupid to realize it. This is why you don't realize your moronic ranting is
also nothing to do with this newsgroup. if you take a close look you'll see this is not
"alt.wanker.bitch.whine.moan".

>
> You must have a web cam to dwell in your imagination. The ones who

> You sure you want to continue and continue to be rediculed?

Again you resort to pre-adolescent fantasy. You've just reiterated one of the sure signs of KOOKdom. You've just
accused me of projecting. Yet you're the only one here defending a porn freak. You've also avoided the question of
why you need porn instead of getting a life and a real girlfriend (the rest of the world knows why, but you are still
unable to admit it).

You should hear the comments I receive from friends when I show them your incompetant spew. They laugh at you as
loudly as I do. So far the kindest comment about you they've made is "What a F**KING RE***D!!!" in between fits of
laughter. Another swears I made you up as some sort of odd joke insisiting anyone as moronic as you could survive
anywhere in society without someone kicking the crap out of you on a daily basis (personally I wouldn't bother,
you're too much of a laugh).

Hey Wanker,

You still don't get it and never will. But that doesn't matter, nobody believes
you anyways.

Peter Sinrlap Dork wrote:
>Gives a new meaning what a schmuck one is..Getting under your toes..?

Getting under toes? Peter, have you gotten your moronic ass kicked AGAIN!!

> Me to...I get a kick of your tone and over reactions...I did not know
> that my calm wisdom pisses you off.
>

HAR HAR HAR HAR. It's really hard to type this from laughing so hard at you!!!
You're such a vidiot!!!! you actually
think that I or anyone else actually believes you. Here's another clue for you
sinCRAP: you cannot see or hear tones in a
usenet posting. What you're reading is ascii, go look it up on google (go now
I'll be sending you there again in a
minute). Lordy your stupidity is truly hilarious "calm wisdom" are two separate
things that you have never possesed. You
started here years ago screaming insults at atari users, whilst in an ATARI

newsgroup!!! and now your defending a porno pervert spammer. Now you entertain the world by claiming to be "calm" and "wise".. You should send your resume to the BBC, you'd be the perfect target to Lenny Henry's sarcastic humor in his next series.

> Beavis who? You might one to refer to your bunk roomie chunks' on
> this..
>

Something else you can look up on google, that series that was made as a documentary about you and your imaginary friend "chunks". You should get some real friends, a real girlfriend so you don't hafta rely on your buddy "chunks" or on the netporn you've been looking at for years. With your lack of personality and delusions this is impossible.

>
> There is a difference. I never stated in words that I supported that
> particular spammer, just your conneption on sex...Read with meaning...
> A clue will be realized...
>

Yep, another lie. I'm not surprised you've been doing it for years. And if you did get a clue, it would be the first and only time in your pathetically funny life.
Btw, this is the part where you do some more searching on google. search the newsgroups (this one specifically) for your previous posts. There you will read your own defense of a porn freak spammer. Your next job is to go to amazon.com (no not the "erotica" section you've been wasitng your time in) and buy yourself a dictionary, thesaurus, and the full set of "hooked on phonics". After you wade through all that, which at your level if intelligence will take years, you'll realize there is no word "conneption". You should also focus on words such as "Troll", "buffoon", "Pathos", and don't forget the one thats most descriptive of you, namely PATHOLGICAL LIAR.

>
> > "alt.wanker.bitch.whine.moan".
>
> Been there?
>

Yes you have!!!!

> Did no such thing. Need to read AGAIN what I said..
>

YAWN!!!! this lie of yours is the one part of your sad pathetic existance that bores everyone. You said and did exactly that. the only one lying about it is you.

> Now there is a claim that you have friends to divert that you have no
> one except for your bunki chunks'...PUleaZE,,,you alleged to have
> friends and show them what you do on usenet.   What a luZer I am!

Remember I told you to try "hooked on phonics" not "hukt awn fonix". you really
need to improve on that single digit IQ of
yours. The only downside instead of being humorously pathetic, you'd just be a
total bore (but then people call you that
now).

Btw sincrap, I have REAL friends, yes I actually know REAL PEOPLE. I don't need
your want your imaginary friends "bunki"
& "chunks". Btw, my friends weren't laughing at me. They were and still are
laughing at YOU. Thats the funniest part,
your so gormless that people repeatedly laugh at you and call you moronic to your
face for all your whining, screaming, and
lying and you still don't get the point. You're the ultimate 21sth century
example of "The emperors new clothes".

And whenever you do come crawling back to expose your ignorance of the real world
under the light of reality you should
explain that if you still claim to be a macuser (while acting as wintroll
provocateur all along), why haven't you defended
the mac in the csma newsgroup. (btw, your singluar post claiming "hey everyone
look one message makes me a csma regular"
doesn't exclude you from this question).

Still cross posting again eh? So why haven;'t you made a REAL post in ANY mac
newsgroup defending the mac from the wintrolls?
because in addition to being known far and wide as a liar, you'r also a wintroll
yourself.

Peter Sinclair wrote:

> Must of taken huge (a)mounts of brain cells to think of tht..
>

Unlike you I have more than one. I also know how to spell (get a clue: being
hukt on fonix is nothing for you to brag about).

> OH really...Many do...
>

the only thing many do, is tell you flat out that your a loser, a laughable one
at that. But your still too stupid to realize.

> No...You? Yes!
>

I've been laughing at you. The universe has its little joke, and you're it. No
matter how much you scream, whine, throw
meaningless insults, you can't change that.

> Looks like a religious experience above. get back when you are sane.
>

Tifkas, just because your in the catagory of "moron, 3rd clas failed" doesn't make
you sane, it just lets the world laugh at you
all the more.

```
> To many untrue assertions above...You have a wild imagination. I  Must
> be a loner roll playing type..
>

Yes tifkas  your assertions that "pointcast will destroy all atari users" which
you repeated ad nauseam,  even after pointcast was
long gone.  Or your imagination that Dan Dreibelbis was a character on the
simpsons. among many others that will be featured in
the alt.loser.tifkas.faq

> Read again.  There must be a language barrier with meanings hat must
> not compute up north..
>

I have read, tifkas,  you have not because your incapable,  that is the only
language barrier.   But expecting anything else of
you is expecting too much since you do none of your thinking north of your
beltline.  Not surprising considering your IQ is
measured in nanometers.

> Here I go again.  A pathetic attempt to prove....
>

You have nothing to prove.  You know nothing therefore you lie to make yourself
feel important.  Too bad for you that lies cannot
be proven.

> Don't need to defend.  If folks want to spend hours on tech support
> with Dell, thats their business.

Its certainly not your business.  You've never proven anything you've said since
you've lied all the while.  Everyones known for
years that you know nothing of the computer industry since you're not part of it.
Years back when you claimed to work in "A major
university IT department"  you started making your wild claims.  You still haven't
realized it but thats when your house of cards
fell down.  You couldn't identify where it was that you worked,  and when people
started checking, it was soon uncovered that you
didn't work in any university or anywhere else in any computer related capacity.
You're just a loser who is bitter at those who
do know of what they speak.

Are you still here displaying your complete ignorance about the video world? You haven't moved on YET?

You can't find anything better to do than post your moronic macparrot drivel on an ATARI newsgroup?

Man, you are sorry.

It's the same TIFKAS who said years ago that Avid was dead. Guess what? They live!

How many major feature films were cut on Avid this year? Too many to count.

How many were cut on FCP? Er... none that I'm aware of.

I suppose you must have missed the DV Mag review of the Avid Express software only editor... at $1500, DV mag rated it much higher than FCP. Oh, unfortunately it's only a PC app.

Just so you know, I LOVE FCP, it's a great app... but don't believe idiots like TIFKAS. Remember, he's the moron who never heard of Pro Tools (the MOST POPULAR audio editing system in HISTORY) yet was talking smack about audio.

Post # of 112380

Schiller talk ...
I went to the Phil Schiller Keynote at DVExpo and here are a few notes
from what I saw.

First, the room was standing room only and had seating for about 500.
When asked, about half had already worked with Final Cut Pro.

The talk started with the ususal review of Apple strengths, such as
Gigabit Ethernet, Huge Ram and drive capabilities, and the Titanium
was continously mentioned as a possible edit platform. He went over

the fact that iMovie and iDVD were the number 1 "civilian" editing programs for movies and DVD. [The audience was almost 100% serious DV people, and then there was me.]

He mentioned Final Cut Pro and then introduced Jean-Pierre Isbouts, who created a TV show "Walt: The man behind the myth" (Walt Disney) completely on a Macintosh using Final Cut Pro. He had some 75 inteviews, which occupied 35 hours of film, along with another 30 hours of background material. He normally doesn't do editing, but, in this case he wanted to and Final Cut Pro allowed him to do it completely on his Macs.

Then Phil talked about OSX "the first UNIX for video pros" and talked about how media is at the core of the os [Quartz Compositer]. He then introduced Final Cut Pro 3, the new version for OSX. What's new, you ask? Well, FCP3 is the first program that allows Real Time Effects completely in software. Specifically it can do transitions, Title, and Color Correction. In addition there is a new codec in the Program [OfflineRT] which allows high compression of original video for work offline (read that on a Titanium). So, instead of 5 minutes of original video per Gigabyte of Hard Drive space, the codec makes that 40 minutes of Video. That means that a Titanium can hold 24 hours of raw video on it's hard drive for editing.

Then there was a demonstration of FCP3 (on a dual 800) doing all of the new items above. In a typical Macintosh fashion, he took a piece of DV that was way too blue (no white setup) and with the new color correction panel, made it usable. Then, because there was another cut from the same camera setup later in the mix, he simply cut all of the color adjustments (many, many color adjustments) by pressing a button in the program and instantly adjusted the other clip, even though it was not sequentially in the movie. Ohhhs and Ahhhhs. Then they showed a transition, with a title flying in from the right, all in real time. More Ohhhs and Ahhhhs.

FCP3 will be available this month, and the upgrade will cost $299 ["Less than an iPod", per Phil]. The Full product is still $999

Then Phil introduced JJ Abrams, the producer of both Alias and Felicity. JJ went on to tell the tale of sitting in an editing booth with his editor and trying to edit a fight scene from Alias, and just not getting it right. He downloaded the clips to his Titanium, flew to the East Coast for a wedding and on the trip back edited the sequence on his Titanium. He then returned to the editing booth and showed the "amazed" editor exactly what he wanted.

After JJ Dave Trescott of Adobe demoed After Effects, doing some incredible scene insertion while the main sceen was panning.

This was followed by Mike Evangelist, the director of Apple Pro Applications, demoing DVD Studio Pro, the OSX edition, which will be released in the 1st Calendar Quarter of 2002

That was about it. I heard people discussing how this and that
hardware/card manufacturer were going to be in real trouble. Apple
appears to be doing fairly well in LA LA Land.

YOU ARE A STUPID FUCK. Pro Tools is NOT the standard on Windows, moron. Again,
the more you say, the
more you look completely ignorant.

You are trying to look knowledgeable about audio and video, but you don't have a

clue. Twinkie, give up
on the audio/video world. You have too far to go to catch up. Stick with the Macparroting in general,
and don't get specific... you'll be much better off.

>
> Remember...it's in the software stupid!'' Not overpriced
> dinosaurs....

Well, it's the RELIABLE software, and it's the FAST software, that hollywood needs. If you had a clue,
you'd realize that movie studios don't care about spending $100k on an editing system for a $30 MILLION
movie, if it's faster/more reliable, which it currently is. Duh, stupid fuck. FCP is great for the
money, but it STILL doesn't have a titling tool that's even useable. Yea, I'm going to give up my Avid
for it? Right, twinkie.

Hey Petey boy,

You know for such a slow response you certainly had enought time to come up with a new set of lame excuses.

Peter Sinclap wrote:

> Just condemned about all on usenet including your fellow jihads...
>

BS as usual, you must come up with a new one, the only "jihad" going on now are 2, one involving dustbin laden and the other in your
petty little thing you still call your "mind".

> An expert on losers? I am the one who is bent out of shape and
> foaming..Just cool and calm...
>

No you're memory is gone too, faking forgetfulness won't fool anyone Tifkas.
We're all laughing at you, have been for a long time.
The more you throw your little hissy fits, the lounder people will laugh at your lunacy. If it wasn't for your insatiable obscenity
you'd be a regular feature on the comedy network. But since they only require literate people who refrain from public consumption of
hardcore porn, you're disqalified from that. Not surprising considering your rather empty career to date.

> Just described myself. Who is jumping up and down while foaming?
>

You are, the more the rest of us laugh at you, the more looney you become.

> The world is defined as 162 countries and six billion folks. I doubt
> that many are following this thread. Quit assuming...
>

Yes you should quit assuming, thats all you've been doing, arguing against already proven fact with nothing more than your laughable
idiocy and your imaginary friend "chunks". It's very telling that of all the population of this world you're only friend exists only in
your mind.

> I doubt that many Atari users are using the fuji computer as their
> main internet surfing tool...That includes chunks 'Dreibelbis'...
>

More than you can count (not surprising since you lose track after running out of fingers to count on). Go ask Alexander Clauss. If
you really were a Mac user like you'd claimed to be all these years you'd know who he is and how he would know.

Btw, I know who Dan Dreibelbis, he isn't your buddy chunks, you see Dan is
whats known as a   REAL PERSON, not a sock puppet or your
imaginary friend.

> Whats nonometers? Wha measurement formula do you use to compute, or
> is this made up from the cartoons?
>

No Tifkas, its called a Unit of Measurement, I'll even give you a clue this
time, It's Metric. You've once again unwittingly revealed
your total lack of education. Perhaps if you did bother getting any education,
perhaps you wouldnt be so completely illiterate and
functionally useless

> what lies?
>

Everything you've ever said. Thats why you wont' bother heading to google to
check the archives of your previous posts. You keep on
lying to everyone and then lie again claiming "Tifkas never said that"

> So your denying that users don't spend hours on tech support with Dell
> and others? well i got news for you...
>
> Oh that was a thorough search indeed... nuff said..

Again you FAIL to duck the point. was a measly few weeks ago you were still
pretending to be a mac user rather than the pathetic
wintroll that you truly are. When challenged as to why you never defend the mac
on the MACINTOSH NEWSGROUPS, you posted one single
solitary message in csma claimign "see I do post in a mac NG", and then once again
dissapeared. Yet you continue to plague other
newsgroups pretending to be a mac user by idiotically trying to insult everyone
else with your whining. The net result is you, living
alone in your basement, all the while being laughed at by everyone for your
blatant stupidity

Believe it or not, the moron Tifkas has been at this line of stupidity for years. But he's finally realized
(after YEARS) that everyone knows he isn't a mac user by the obvious fact he never once has defended his
imaginary mac from mac bashing wintrolls (I've done far more than him in the past month and my mac doesn't
even see regular usage).

```

I've recently heard the google archives have been updated to go back to 1981 now,
not that you'd find so much from
that far back since its long before most of the internet was publicly accessible.
But then Tifkas will claim thats
when "he invented it" no doubt.

Of course your not going to give up on the Avid hardware since the
cost has to be ammoritised. but you may not upgrade to new Avid
hardware in the future will you?

Avid is in a pannick. Thats why they have the $1500 insurance policy.

Hhahahahahaha,

Sinclap your foolishness is still making us laugh at you. What makes all the more funny is that you actually
believe your own crap. Everyone who actually works in pro audio / video arean uses AVID, and their stuff is
fairly commonly used Macintosh hardware. Yes the very same macintosh hardware you've been claiming to
"defend" for years which you know NOTHING about. After all, you are a wintroll which precludes you from
having any real knowledge. I think you'd be a good candidate for the Humphrey Appleby award for your
lifetime devotion to recursive bollox.

Well I really don't care what you do in the bedroom with your imaginary friend known as "chunks". Thats not surprising though considering that since you've spent your adult life in mcdonalds manning the fry station. It goes a long way to explain your preoccupation with your imaginary friend, your preoccupation with online porno sites and your general lack of hygiene. Take the hint tifkas, those things callled SOAP and WATER will help clear up your complexion, and your filthy bizzarre mind (which in itself wont take long to clean on account of its small size)

> Oh oouuie...Did chunks' brain farted on that?
>

Since chunks is your imaginary friend that explains the foul odour emanating from your mouth every time you start ranting. You should change your tin foil hat to the larger size, perhaps when you take your annual bath, that should cut down on your pungent emanations.

>You may have to read above for meaning and style...So who is giving 'hissy fits'?

You of course, thats why everyones been telling you that for YEARS!!! why haven't you figured it out yet? most likely cause "Hukt on fonix werkad fer tifkas".

> chunks' exists. You should know...he is close to you at all times.
> Sheessh...fighting your bro battles that he can't finished..
>
>

Chunks exists in your imagination. btw, your imaginary friend is close to you alone. you don't live near me, I'd spot you miles away fromt he toxic fumes emanating from your unwashed mind. You've just proven that chunks is your imaginary friend by calling him my brother. Anyone who has a clue realizes I dont have a brother (theres your problem again, you don't have a clue). I'm not surprised you don't know where your imaginary friend is. after all it was you who, less than 6 months ago, claimed minnesota was 300 miles north of china while trying to deny that you live in your parents basment.

>

>
> Ask yourself...
>

Why should I do your homework for you? its much more entertaining to laugh at your obvious bollox cause you cant be bothered to know of what
you speak.

> I never said he is my buddy, but he is yours in a bro way...
> Sound like you and bro compare you know what under covers ...
>

There you go witht he porn again. I've told you to cut down on the fries while your working at mcdonalds and to start bathing, then you
might have a real friend someday instead of relying on the online porn

> I supose working in a hardware store will give you a legg up on this.
> but market dynamics is out of you and bro leagues..
>

HINT: leg has one G. (there you go with your "hukt on fonix" again).
you should take note that your job as part time fry station cook at mcdonalds will teach you NOTHING about market dynamics, thats why you
still don't understand the subject.

>
> Sounds like generalization without substance..
>
> So were is the Hades/Milan 2-3? There was a lot of the foaming at the
> mouth that this new fuji unit would be available on this side of the
> Atlantic over a year ago..
>

Yes perhaps you are starting to see what everyones known bout you for years, you generalize without knowing the facts while foaming outright
lies to cover your ignorance. You've had this hint before: check the google newsgroup archives. it goes back far enough to include everyone
of your lies such as "pointcast will destroy all atari users" and "atari jihads are out to get tifkas".

the Milan was out for quite a while before a year ago. several have them. Same for the Hades. My first use of a hades was in 1996. The
sucessor to the hades is in development now. If you'd take a look around instead of sticking your head up your fat ass and blowing your

brains out when you fart, you'd already know that.

> Thats news to me. I swear that I have an iMac/ibook wireless/dsl set
> up at home while typing this.. Could be delusional...-)   Don't think
> so.

Since you've spent all your time attacking other computer users and never once attempted to defend the mac against your fellow wintrolls & sock puppets (all 2 of them) its become clear that you don't have a mac, and never have. You're an obvious wintroll who's shallow flatulent tactics have failed. But not without providing hours of laughter for those who see you as the clueless ballmer groupie you've been all your life.

>>
>
> Oops..Pro Audio...Your attitude makes you silly.

What are you even saying? You are smart enough to not elaborate because you would display your ignorance yet again. It appears you are learning something.

There are several DAWs that are much more popular on the Windows platform than Pro Tools. Pro Tools is only the "standard" on Macs.

> Sounds like you can't take it anymore. Defending the Avid purchase
> arn't you?

Er, no twinkie. My Avid has been paid off for several years. I just bought a new dual 800/FCP setup BTW, so why would I feel a need to defend my Avid purchase? I could decide to sell it tomorrow if FCP was good enough, and I would lose nothing... heck, it would get me some more money for other studio purchases, I'd love it.

There's a reason I haven't done it, twinkie.

> Of course your not going to give up on the Avid hardware since the
> cost has to be ammoritised. but you may not upgrade to new Avid
> hardware in the future will you?

Yea, read the paragraph above again. You really are a moron.

>

> Avid is in a pannick. Thats why they have the $1500 insurance policy.
>

My Avid works.

My dual 800/FCP setup would no longer capture without dropping frames after I installed FCP 3. This is a simple DV stream, 5 megs a second tops. This is trying to capture to my Medea RAID, which can handle 40 megs/ second without breaking a sweat. Oh, and it's also the same FCP that has such a crappy titling tool that it requires me to use After Effects for all titling.

It's about reliability, twinkie. FCP will be a threat to Avid when it works reliably.

BTW, I'm sure you heard that Avid has announced they are going to release a software only Xpress DV package. It will be interesting to see how many people bypass FCP altogether now for a more complete package for $500 more....

>
Pro Tools is the standard in digital music production and is used in
the majority of recording studios across the country. Notice I did
not say "your house" because on the PC platform there are simpler
packages for the casual user. Pro tools is not meant for playing with
MP3's and swapping music files. Pro tools has a high learning curve
and generally tends to separate the novice from the professional. The
majority of studios I have been in do use Macintosh setups (and
usually dedicated ones) however I have seen many PC's that use Pro
tools also. It is not simply the standard on Macs, it is a standard
of the professionals. And it has won a Grammy award!

"Digidesign's Pro Tools evolved from a four-track computer recording
and editing system in 1991 to today's premier multi-track digital
audio workstation for professionals. Designed by and for musicians,
Pro Tools has forever changed the art of making music and is now at
the forefront of the industry's top recording studios. Pro Tools
provides the professional music, film, video, multimedia, and
broadcast radio industries with CD-quality digital recording, random
access editing, advanced signal processing and digital audio mixing
applications.

Digidesign's innovations including Time Division Multiplexing, Real-Time Audio Suite, DirectConnect and more have revolutionized the industry and paved the way for widespread use of digital audio workstations(DAWs). Pro Tools was used extensively in the production of Carlos Santana's multi-GRAMMY winning Supernatural, as well as in recent recordings by Ricky Martin, David Bowie, Mariah Carey, TLC, Nine Inch Nails, Garbage, Beck, Limp Bizkit, Kid Rock, Everclear and Wynton Marsalis to name just a few. Pro Tools has also figured prominently in the post-production of many motion pictures, including Titanic, Star Wars: Episode I The Phantom Menace, and American Beauty."

Nuff said!

It might be the "standard" for music production, and low end post.
There are other packages that are also very popular for post.

Thanks for the post, but you missed the point... Pro Tools on Windows is
NOT very popular. There are much more popular systems on the Windows
platform.

It goes a long way to explain your preoccupation with your
> imaginary friend, your preoccupation with online porno sites and your general
lack of hygiene. Take the hint tifkas, those things callled
> SOAP and WATER will help clear up your complexion, and your filthy bizzarre
mind (which in itself wont take long to clean on account of its
> small size)

Sounds like you know the drill.   Only one with experience could of
come up with soap and water.. You and chunks' ought to try it
once...ie double dating. Would make your parents proud and a process
to leave the attic once and for all.

> > Oh oouuie...Did chunks' brain farted on that?
> >

Hey Petey boy

Your still insisiting on being a totally clueless fucknut I see. I'll give you a few clues to get you
starting
1) his avid works
2) because of clue #1, he doesn't need another one!!!

So ASSHOLE, why would he buy another one when He already has one that works

Hey vidiot:

Here it is spelled out for your damaged little mind:
1) you atack atari, amiga and other computer users
2) you fake being a mac user to provoke other computer users to attack mac users
3) you never devend your imaginary mac in csma from wintrolls and in fact quote

them verbatim in your attacks on
everyone else
4) you've publicly admitted you don't participate in csma cause you claim that
your "dell works perfectly all the
time and don't need tech support for it"

So, ASSHOLE, we laugh at you frothing at the mouth all these years as you think
you can fool us all when all you've
fooled is yourself cause in the end as always the only fool here is YOU

Heres more cluse for you asshole,

1) see those spams (the only ones here you didn't post) that advertise the sex

sites you love so much. its called porn.

2) my life experience includes soap and water cause I and many other people do
something called hygine, something your sorely lacking which also
partly explains your fascination with your imaginary friend chunks

3) We laugh at your hissy fits and lack of any kind of spelling or grammer cause
face it we know your a idiotic 12 year old with delusions of power.

4) The rest of your drivel will not be replied to since its pointless, the only
point you have is under your tinfoil hat.

Has anyone heard if Tech TV will do a live coverage of the SJobs
keynote like last time?
Sure hope so....Rather be comfty at home while nursing a cup of joe
than being crushed with 300 or so at the MOA.

> It's a broadcast weekly show..

Really? You discovered that all on your own? Amazing.

Twinkie, you brought up "Felicity" as an example of FCP being used to cut a feature film in response to me.
Felicity is NOT a feature film.

> I am learning everyday, a never ending process.

Keep reading.

> So why not a new Avid purchase?

Well, let's see. I already have one, and it still works.

Let's compare that to the machine my dual 800 replaced, a G3 400 that was originally purchased as my second editing station. I'm already replacing my G3 because it isn't fast enough.

The Avid? I'm keeping it, because it always works. It's based on a 9500 by the way... and it still runs at a decent speed.

> > There's a reason I haven't done it, twinkie.
>
> Whats that?

I'll spell it out for you: R.E.L.I.A.B.I.L.I.T.Y.

> Name calling is your trade mark..Is that hw you act on the other
> boards? Sound like chunks' when it has a fit...

So be it. Your trademark is to come here and make an ass of yourself, while demonstrating your ignorance in my area of knowledge.

> > My Avid works.
>
> But you are not buying another one...

Yea, because it still works after all these years.

> Yea...After Effects is a worthy add on..

It SHOULDN'T BE necessary, if Apple would create a halfway decent title tool.

> > It's about reliability, twinkie. FCP will be a threat to Avid when it
> > works reliably.
>
> Does not work reliability yet?

Again, it will NOT capture without dropping frames in OSX or OS9. That's version 3.

Version 2.02 will crash EVERY TIME when batch capturing long clips and give me an "out of drive space" error (even though I have much drive space, 200 gigs worth).

> > BTW, I'm sure you heard that Avid has announced they are going to
> > release a software only Xpress DV package. It will be interesting to
> > see how many people bypass FCP altogether now for a more complete
> > package for $500 more....
>
> You mean how many will bypass the Avid hardware all together..

No, I mean how many will go the Avid route instead of the FCP route. Markets are liquid, twinkie. Avid built hardware because computers couldn't keep up. But much like Pro Tools, they STILL have the best SOFTWARE out there, and the best software goes a long way when you're looking for reliability.

No he wont' be since hes a wintroll not a mac user (as further evidenced by his total bullshit regarding avid's AV tools). He's famous for years now after repeatedly coming on here and trying to bullshit everyone how he went to macworld and other apple trade events (which he's never been registered to enter, not even once).

nope..not this time after two years in arow.  may attend the july/aug
show in ny.

thats why if anyone new if tech tv would provide live coverage like
last time.  the answer is yes..

Bollox again.   I've even posted about you there, I've posted TO YOU there, and you never reply, you never defend the macs from windroids. jThere fore you are still a liar and a blatant scumbag. Not that its a surprise to anyone. For the record everyone here KNOWS you don't visit csma cause you idea of "defending" the macintosh is limited to spewing crap at others while hoping that nobody will realize your a pimply faced loser without a life.

lets see thats gmt so in fact your posting at just past 1:30 am while
staying up late on saturday.  Does this prove anything?  yes it proves your
still an idiot for thinking that staying up late on a weekend somehow makes
you a "hacker".

Care to back this up. What have I stated that is crap? Ex..That the
updated Milan will never be released on this side of the Atlantic?

```

Well, you just condemed millions in the technology field, including
fellow atarians..

You sound like the class wise ass, always perfect...but rediculed..

you live next door with Chunks? Why are you defending Chunk's sexual appetite? Did you know by diffinition in posts by Chunk's attacking my spelling and grammar errors done early in the new morning, that he has condemed you as an idiot and unworthy of a amployment advancement?

Why should I care that wintel users do not use the Apple platform.
It's there loss not mine. I suspect that the new Apple retail stores
will attract the fence setters and the low hanging fruits.

So what crap have I spewed?

millions in the technology field know how to spell. Unlike you.

> You sound like the class wise ass, always perfect...but rediculed..

no, they laugh WITH me, not AT me. With TiFKAS it's the opposite.

BTW, it's spelled "ridicule" . Come back when you've graduated
remedial kindergarten....

> > yes, TiFKAS, we all know about how much you like to "Palm"
yourself :)
>
> You must of erotic thoughs about being 'Palm'. You thought of it first

hmmm, not only can't TiFKAS spell, he also can't put together a
coherent sentence! Having fun with your old friend Johnny Walker again?
:)

> > it did - the whole book is tull of the facts about Atari - and
proved
> > that, as far as your disinformation campaigns, you're full of it.....
>
> What disinformation campaign?

well well well. Remember "98% of all Atari applications fall over on
the Milan" ? Remember "Pointcast will completely destroy Atari from
the Internet"? Remember "I never said Calamus was crap"? Remember "I
never said that Steve Jobs would destroy Apple if he ever came back, or

that I called him an arrogant bonehead"?

> >   You're certainly not serious about getting ahead and bettering
> > yourself, can't even spell "ecstatic"

I have bettered myself, pinhead. Last March I got a promotion, a raise, and some additional employee training which has now added to my resume.

You'd be lucky if you were able to sell pencils from a tin cup, much less getting any job in the computer industry.

> *note, sinclap maybe absent due to sending back the field PB to former
> employer..

well well well - someone finally noticed your shoddy work and gave you the boot. That's what you get for acting as much the fool here as you did in the field.

BTW, can you now give us evidence of who formerly employed you? Or are you still bound by a "non-disclosure agreement" (read: BS) that prevents you from sharing that info, O former fake "Apple Power Rep".

Lets take stock of this right now. Has anyone here in the atari groups or in mac groups
(that you never post in, yes I've checked) ever agreed with you? NO
Has everyone you've ever communicated with in this newsgroup or any other called you a
brain dead idiot? YES

Btw, since your American (which is acceptable on its own) and Incredibly Stupid, in
fact the Taliban would either laugh at you or at the very least insult your lack of
intelligence.

>
> Care to back this up. What have I stated that is crap?
>

I don't have to back up the fact that your an ignorant liar. You do such a good job of
that yourself. Such as your blatant lie in this very post that your an Atari user.

Take a hint, atari users don't spend their lives bashing atari computers and other atari users.

Theres also your bogus claim to attend tradeshows including Macworld in NY and SF. Despite the fact that you've never been seen there by anyone. The mere fact that you can claim to be there and be totally invisible to the thousands of attendees is absurd to everyone but you.

And lets not forget your laughable attempts to delude yourself that you want to be an "apple power rep" in your professional capacity even after its been proven many times that you've never worked for Apple or any Apple dealer.

You see, it goes to your own credibility. You make wildly stupid accusations against others. Then you contradict yourself. To top it off you wont provide evidence when pressed repeatedly. The result of this is you're universally recognized as an utter fool.

> Whats there to post?   It's an advocacy group too, plus I am a Atari
> user as well.

You an atari user? absolutely not. you've disproven this many times with your egomaniacal diatribes bashing atari users over the years. Yet you continually claim to be a mac supporter. This is not born out by any facts, in fact your own statement above proves quite the opposite.

"whats to post?" you ask? despite your claims to being an apple user you never venture into any of the mac newsgroups defending apple from the mac bashers who spew the same idiotic BS that you mindlessly fire off at Atari users.

The facts are that your simply trying to inflame people against each other. But your silly little school yard bully plan is foiled by to blinding facts. (1) Your stupidity is so obvious and self contradictory that it invalidates itself (2) More than a few of the people you bash are at one time or another people who've used both Atari and Macintosh systems. In essence your attempts to provoke Mac and Atari users against each other are attempts to get people to attack themselves.

> I have posted...Have not seen a post from you lately..

No you have NOT posted in CSMA, ever. Yes I've checked, So do Dan and Razor (and I know who they are, personally, so unlike you they're not liars). The REALITY (as opposed to your moronic fantasies) is that you don't take part in CSMA, EVER!!! you don't even go in there. The proof of your sad lies are in the plainly visible evidince is that when called on your lies in the atari groups you reply within hours. Yet when I, Dan or others call you on your crap in CSMA or other mac newsgroups you never respond.

Read the paragraph below, a paragraph typed by YOU tifkas. Thats more of your crap. Read your previous posts and count the direct contradictions among your previous statements. Enough crap to drive toilet paper production into overdrive.

While your on the topic of low hanging fruits, its obvious why you care about what
wintel users think. Primarily because you are one.

>
>
> Why should I care that wintel users do not use the Apple platform.
> It's there loss not mine. I suspect that the new Apple retail stores

Hey numbnuts,

Get another clue (or another brain cell your choice). Pornography isn't sex, it isn't even a substitute. Porn is a lame 2 dimensional pervisity much like you are. Perhaps if you could ever find a girlfriend (which is an outrageous stretch of the imagination, even for you) you'd eventually figure out the difference between porn and a really good thing the rest of the world calls having a life.

Tifkas,  how many clues will it take before you grow a brain for yourself?

Look at the message header,  in there you will find a REAL NAME!!! Unlike you I
don't hide from the world at large.  But then if you didnt use your alias people
might actually start looking you up and once again start confronting you with more
documented evidince of your lies.

Its more likely an immature ploy.  Actually quite typical of the idiotic think
tifkas would do.

Atari is now owned by Infogrames and the did pay a few million dollars for
it together with assets of Hasbro.

Are you willing to pay this amount of money for Atari? Hmm that would be
cool... let us know what you're up to..!

Hmmm, Hasbro had the home system rights after they bought it from JDS, they may have sold it again but I cant remember the name of the company at the moment. It would be good if something materialized other than just another port of old arcade games to windows.

>Hmmm,  Hasbro had the home system rights after they bought it from JDS

That was JTS that sold everything to Hasbro Interactive.>they may

>have sold it again but I cant remember the name of the company at the moment.

Infrogrames recently bought Atari from Hasbro Interactive.

>It would be good if something materialized other than just another port of old
>arcade games to windows.

Since Infogrames is a games company, it's highly unlikely you'll see anything
but games with the Atari label on it.  Atari as a company - at least as we knew
it - is in the history books.

Hey, Baiz! Wanna plot the next Atari revival again? :-D

Actually, if anyone is willing to listen to my ramblings... Atari's revial COULD happen, albeit without the name Atari. Remember "Neotari" ("New

Atari", get it?)? Well? What's the diff if people run/port their apps on the Neotari [whatever], which would be a PowerPC based computer running FreeMiNT (and a proprietary GUI) or a genuine new Atari computer (which is about as likely as water becoming dirt, these days)?

The whole Atari scene is dying and not a whole lot is going on to stem the tide of death washing across the landscape. I still say we ought see if a USA-based Atari "clone" effort (properly devised & supported) would work. But that means more than me. That means people working together for the total project. A single aim. A single purpose. No divisions of idea or concept. The leader of the project would be the final say-so on everything. That's what a CEO does.

It takes imagination to create a BeOS (thank you, Jean-Louis Gassee'!). It takes imagination to save Apple (thank you, Steve Jobs!) Never say it can't be done again, because these two people have proven that it CAN! It just takes people willing to believe that what one person believes in, CAN happen and WILL happen.

Jared

The IBM publicly-available POP designs and Bill of Materials for the latest version.

For this stage, I need someone (or a couple people) who are familiar with PCB layout/design.

For the next stage, I need someone (or a couple people) familiar with programming MiNT, FreeMiNT, SpareMiNT, etc.

And, does anyone know if/where a generic Atari ST emulator is in the PowerPC sector? Source code is a necessity and a person (or persons) who can code. The original programmer would be best.

"All it takes is just a few people to start agreeing..."

Jared

Unless...

We regain the Atari brandname. Otherwise, we'd just be porting Atari apps to run under a different processor/OS platform. That doesn't make them Atari apps any more. It makes them X-app running on X-hardware. It's no different than porting any game from the arcade to the Playstation, or WordPerfect from DOS to the Atair ST. The reason those apps were considered Atari ST applications was because they were *unique* to the Atari ST! And, if they weren't, they were usually only ported to or from the Amiga platform.

If the effort to "revive Atari" is to have ANY hope, we must go to the source (Infogrames) and reaquire (by license) the Atari name with reference to a computer/hardware division.

However, we must be resolved to do this. We must see that anything less is utterly a waste of time and pointless. Emulation, for the sake of enjoying the "old ways" just one more time is simply a time-wasting "nostalgia trip". If we are so desirous to get back to the days of Atari's golden age, we must realize that it involves the NAME! An Atari computer is NOT an Atari computer unless it is called an *Atari* computer. And, none of the clones, regardless of their ability to run Atari ST/TT/Falcon030 applications are Atari computers.

And, worst of all, they will all die, if they haven't already.

We are in the last days of "Atari". The fumes the die-hards have been running on are evaporating into nothingness rapidly. Eventually, there will be nothing left and no one to care. And Atari, as a namesake, memory, and gaming pioneer... will be lost forever...

Say what you will, but you must answer me this. WHY do you use an Atari computer and the software that you run on it? Is it the applications? Is it the brandname? Is it the uniqueness of the hardware? Or is it just fond memories that keep you going?

If owning and using an Atari ST computer (or clone) is so important, then why isn't reviving the company that started it? It's not about the people who worked at Atari... they KILLED it, remember? It's not about the designers who made the cases (though I am still very partial to the 1040ST design myself), they've moved on. It's not about the features or limitations of the system. It's about the NAME! The company! The meaning!

An Atari computer isn't an Atari computer unless it's *called* an ATARI computer!

If you say that the name isn't important to you, then why do you use an Atari computer? If you say it's not the applications you care about, then why do you use an Atari computer? If you say it's not the nostalgic memories of having a computer that was ahead of the rest in it's day, then why do you use an Atari computer?

Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that, if "Atari" were to make a comeback, and started manufacturing computers, PDA's, laptops, and more again... that you wouldn't be thrilled?

If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is an issue of pride and trust. Sure, that trust has been marred by the people who owned it before and the name "Atari" is merely being leeched for some game titles by Infogrames. "Atari" hardly means anything but "dead, ancient game company", these days, but when it was first created, it meant "Success!" (I believe that's the correct translation, if memory serves me right).

We can't bring back the past, but we can enjoy the present. I would love to go back to the days when The CareBear demos and STOS and Brattacas and Barbarian and BloodMoney and Shadow of The Beast and Xenon and 1st Word and DBMaster One and NeoChrome and all those other games and programs were around. If I had my druthers, I'd turn back time, stick myself right in the crux of the 1040ST years (there were at least three or four, weren't there?) and put it on an endless loop! I have NEVER been that happy. I've come close, but just when I think I can regain that same state of bliss, it vanishes. Why? Because BeOS is dead. Because Macs are too expensive...

Because nothing, but NOTHING... is the same as owning an Atari 1040ST back in 1986, right after my graduation at Pasadena High School. Do you even realize how excited I was when I saw the first 520ST ad in a magazine? Do you know what my reaction was when I saw my first 1040ST ad?

I remember it like it was yesterday... I owned an Apple IIc at the time.

The instant I was finished drooling over the ad and the features the 1040ST was boasting, I said one thing to myself...

"I'm getting it."

And as soon as I graduationed, I sold my Apple IIc and had my mother drive me to ComSoft in the Sun Valley, CA (I forget exactly where it was, but it wasn't too far from where my friend , James, lived at the time), and I bought one.

[Anyone remember "Logical Choice for Computing" in California?]

And if any one of you have even the tiniest HINT of a cranial concept of these same emotions, you'd realize that the name 'Atari" means almost more than the things they created. Shoot, they even made/sold CALCULATORS, for crying out loud! And, you know what? I'da bought one. I was so proud of my FAVORITE company. I wanted to work for them! I looked forward to going to the computer store to see what new software was released. I bought Joust and Star Raiders as soon as they were released. The list goes on and on...

I also went to every Atari Faire in Glendale, Ca. From the first to the last.

But those days are gone. The games were all so deeply copy-protected and tightly wired in Assembly Language, there's little to no hope of ever getting them ported to new hardware, with or without the Atari name. Psygnosis is dead (or at least I haven't heard anything about them from within Sony in recent years). Those games are dead. STOS is the same way.

The only thing we could do is find the programmers to port any and all possible ST applications to the new hardware. I believe, beyond a shadow of a doubt, that if Atari started making computers again... computers that had an OS that was simple and fun to use, but more powerful than TOS/GEM was, had some really nice hardware under the hood, and boasted of "Power Without the Price" again... we'd see the "old ones" coming out of the woodwork. And, I tell you this... I'd buy one in a heartbeat... even if it *wasn't* "leading edge".

Why?

Because it would be... an Atari!

Jared

Hi Jared,

I do like this project your proposing. And I have one very practical reason for doing so that you havent mentioned. I am not just an diehard atari user cause I like them on their own. But I also have very valid uses for my Atari gear. Every day I'm using one of my atari machines for not just "fun stuff" but for doing real work on, not because they're the latest machines but because they get the job done reliably which is more than I can say for most of the windows based machines I've used over the years. And no silly irrelevant buggy emulator offers the same functionality comes close, period.

ttyl,
James

To prove that such an effort CAN be done, just go to:

http://www.beunited.org

These are a group of people trying to save BeOS by *licensing* the source
code *from* Palm. Assuming the sale of Be's IP (Intellectual Properties)
goes through, we're all hoping they succeed.

All I want to do is license the brandname "Atari" (and access to all
computer-related materials, schematics, source code, etc.) for use in
re-creating the computer division.

However, aside from the relative "simplicity" of this plan, we need to find out just how many people (current and ex-Atarians) are willing to go with this plan, provided they realize that the name and the products that go with it is what this plan is all about.

Yea or Ney. Yes or No.

There are other aspects of this plan that are pointless to even mention until we know just how many are willing to commit to the plan and put their name and Email address in a list (petition).

The first step is to marshall our forces. Once we can show just how many are going to be involved in different aspects (buyer (i.e. end-user), hardware developer, software developer, OS programmer, etc.) of the plan, we find out what we need to do to aquire the rights (a license) to use the name "Atari" in a computer division. It may require money up front or be part of a "per sale" arrangement (I'm hoping the latter).

I'm sure setting up a site where people can post their name, Email address, geographical location, and "position" (what aspect they want to assist in as part of in the plan), is a good idea.

Like I said, we must be resolved in this effort. That this is the ONLY way. No arguing about how we proceed (suggestions are welcome, however) or getting two or three steps ahead of the step we're in.

Nothing can be accomplished until we aquire the rights (a license) to the name "Atari" and permission to use it to start a computer division. But, in order to do that we must be united in the "how and why" of what we're doing.

If we don't do this right, they'll probably never even consider it. And, even if we do, they may not consider it. But we have to give it our best shot. If we never try, we can't *possibly* succeed.

Afterall, we can't be any worse off than we are now, can we?

Jared

In case there is any misunderstanding of my plan, let me clarify.

The name, "Atari" means nothing. It has no value. Just like "Jared". Just a set of letters coupled together to form a word. It's only when you make an association to something or someone that it has any meaning at all.

My plan is not to license the name "Atari" purely for the sake of the name. That is as pointless as what Hasbro and Infogrames have done.

I truly hope, if anyone from Infogrames is on this newsgroup, they don't become offended, because I believe what they are doing is nothing more than "software prostitution". They are simply pimping the name "Atari" for a few dollars a night (figuratively speaking), based solely on the "recognition factor" alone. Hasbro did the same thing... and look what happened. Now Infogrames is hoping to do better than Hasbro. Will they? Who knows. One could hope, but I seriously doubt it.

When I see the name Atari today, I see nothing. I see a Hasbro or Infogrames game with a vaguely remember name tacked on to it. Sure, it's *supposed* to instill a thrill or sense of nostalgia that will make me want to buy the game. But do I? No. And I probably never will. Why?

Because there is nothing BEHIND the name. No product. No substance. No value. A name without a person is a word. A word without a meaning is babble. Babbling is pointless, useless noise-making. How often do you thrill to hear someone babble? Me neither.

I want to bring MEANING back to the name "Atari". I want people to remember that the name Atari MEANS something. It means uniqueness. It means pride. It means computers.

When you look at a game title on the shelf today that has the name Atari on it, do you honestly believe Atari produced that title? They didn't, because they don't exist anymore. They only existed when they made arcade games, game systems, and computers. All it is is a brandname today. It has no substance behind it anymore. It's a ghost of a word, no longer holding any of the pride and fun it used to represent.

I want to change that...

Jared

You never proved otherwise if the older software would not break.
PointCast was the lichpin of technology for the internet that could
not run on the ST hardware. Nice idea at the time. You failed to see
the point.

A training in the 'snow plows' as the new sales meister is not my idea
of a promotion.

>   You'd be lucky if you were able to sell pencils from a tin cup, much
> less getting any job in the computer industry.

You're right...I am not worthy--)

Hey Tifkas,

Yer still completely gormless. Your reply is just as stupid as your one and only
post in csma when
you tried to prove you post in csma on a regular basis (which you still don't).
Do the world a favour
and grow yourself a brain.

   ah, once again TiFKAS, having nothing to say, attacks the Simpsons.
well, TiFKAS, seeing as Homer is now officially recognized in the
dictionary, I think it shows well that they're respected in the culture.
When will you be in the dictionary - when your picture appears next to
"idiot"? :)

hmmm, no, that's up to YOU to prove your claims, not me. Many Milan owners found quite the opposite.

You fail to see the point about PointCast - you brayed loud and long about how the technology would force Atari users from the net. Instead, Pointcast crashed and burned, and we're still here.

ah, once again TiFKAS attempts to attack the labourer as being unworthy. Remember, labourers and salespeople make a great part of an economy and their money buys computers - which means they pay you wages, pinhead.

No you twisted little shit.  Porn is perverted,  sex isn't.  If you'd cut the crap
and get a life and
a girlfriend for the first time you'd realize this.  Since your the only one
defending the porn
spammers shows how much of a loser you really are.

Should lighten up on trivial matters. Simpson's going strong at 10+
years...Will the show ever age?

You stated it not me. True, that these market segments power the
economy. To bad, that a greater precentge of their income goes to
taxes than the higher incomes who pay less. So who gets screwed? And
why nothing has changed?

Speaking of...Any up northers want a bat ball franchise that could be
extinct by next week? Imagine, the Up Norther Twins...

Hey ASSHOLE,
the only spew here is from you.  Instead of shooting shit out of your mouth go and
read your own idiotic
posts.   It was YOU who was defedning a porn spammer who's blatant bullshit has
almost as little business
as your own crap.  I, nor anyone else have any trouble calling you a moronic
asshole since that is exactly
what you are.  Now piss of to your parents basement and leave those of us in the
real world alone.

There is a FREE IDE interface for the Apple II being planned on
comp.sys.apple2. It uses 7 74 series chips in the prototype. The prototype
works. People are now trying to improve it to automatically recognise tracks,
sectors, heads etc. So the rationale is sound for a niche computer.

Utter crap as usual. I never went around claming atari revivals at all. Whenever I or
anyone else calls you on your many lies you resort to lyinging. Btw, the only bigot
here is you. You continually insult atari users in atari forums. It is YOU who does
the attacking. And only you blowing smoke out of your lazy ass.

> He he he.. Oh sure like you know..

Yet again you spew crap.

You getting tired of me telling you this? perhaps you should stop spewing crap if thats the case. Btw, Your making claims about what I've said in the past. You're also basing your fallacious "story" on ignorance of how the computer industry has been working for the past 10 years. Only one platform is covered, and its not your beloved mac.

Perhaps that statement was worded poorly. The situation referred to is often called "M$ tax." Will M$ let you install a second OS along with theirs?

Be found out the hardway about all this when they tried to license their OS to other hardware venders. (Dell and IBM probably smell blood with M$ recent problems with the DOJ).

I really wouldn't design a $300 home computer. Way too many models of home and "productivity" (read Palm) computers out ther. Let's focus on the hobby computer. Why is the hobbist so underestimated and underpriced today?

The Ideal Hobbist computer would be an Atari-like portable computer. CPU? maybe Z80 or 6502 derivative. A low power RISC or CISC Chip, but powerful enough to avoid the flickers and glimpses in audio and video. And it must have a modest enough memory space for you to write neat apps that don't need 3 CD's to install, but cartridges or Smart Cards.

Since no HD or CD is desired, SmartCard or PCMCIA or FlashCards are desirable as storage media. Also, the back panel must have serial, parallel, and "user" ports. User port should be an Atari, CBM or Apple flavor. So every pin of the CPU and every usable signal in the system is available.

Language? If BASIC is not allowed as the main language, then it should be the rapid prototyping language option, accesible thru software commands or a small switch. But BASIC MUST be included. The main language could be Pascal, but remember that rapid prototyping means no time for detecting every single variable to declare.

Video? Well, since our system is intended to be a field-usable system, an LCD is mandatory. I don't think an SVGA resolution is needed. But a VGA is desirable, and a quarter-VGA is good enough. We want to test system parameters, sensor response, GPS tracking, missile trajectory plotting, or just fish bank detection to be instant represented with our supercharged Game Boy, right?
But remember, we are planning a Hobby Computer, so most of the graphics could be displayed in a TV. Composite Video and VGA outputs are the only two choices.

Audio? Well, it must be CD-quality. No more, no less. Remember we cannot hear beyond 20kHz, so why should I buy a computer able to emit a supersonic or subsonic sound I can't detect? Well... Maybe for Dog training or Subwoofer testing! But anyway, CD is just what we need. And complete control over the waveform thru software.

Internet? Yes! A 10/100 base T interface so I can connect my hobby computer to the local net and download any data I gathered in the field. Just like an internet "appliance". But this could be added with a PCMCIA card.

Maybe what we're trying to figure out is a new, VGA, networkable version of the Radio Shack Portable Computer sold in the early eighties, with an open, well-documented architecture. I can see it: in one hand my hobby computer with a bunch of cables attached and a piece of custom hardware sending codes to the machine. Or maybe, a credit card interface attached to an electronic cashier just like in Terminator 2. Ooops, there are some disadvantages, but just don't see 'em.

I think I'll start designing it, since a computer like that is for us, the inhabitants of the dark, underground world of electronic hobbists. A customizable, in-house expandable, easy programmable box that can be instantly attached to any project just to test or diagnose or in-system emulate. But then again, it sounds like my old Atari!

Microsoft's EULA only restricts how OEM's install Windows, and software
"into Windows", and has no control over the rest of the product. They
can't tell us not to install Linux alongside it.

No...Been busy..Looks like comp.sys.atari.advocacy bit the dust...

As usual, Chretein up north is late to the game...

sinclap!

Most of the mush is in your shorts,  the remainder is in your otherwise empty
head.

>Btw, why haven't you been posting in comp.sys.mac.advocacy?  I mean besides >the
fact that they long since kicked you out for spewing more garbage than the
>wintrolls.

> No...Been busy..Looks like comp.sys.atari.advocacy bit the dust...

Wrong again.  Your crap bit the dust.  How do we all know?  cause your the last of
the kooks who try to bs people here.  Btw,  you never did give a real reason why
you
don't visit mac.advocacy at all.  Truth is you never have.  You haven't been busy
since you've never left your parents basement for years.  The reality of it is you
aren't a mac advocate at all but rather a pathetic loser who attempts to bully
others.  Its unfortunate the pommelling you've taken over the years hasn't yet
taught you the futility of your lies, arrogance and outright stupidity.

nope, he's quite ahead of it. Conrad "Tubby" Black thought he had the drop on Jean, and look what happened - he had to sell the National Pest because, despite all his lies and his attacks about Jean (just like a certain fake "Apple Power Rep" in his attacks on "Atari Jihads" who are "out to get him") they all fell apart like a deck of cards. Tubby has now left the country with his tail between his legs, blaming everyone but himself.

And now look at TiFKAS - once again, trapped like a rat, it has to go and try to attack an entire country in order to feed its frail little ego.

And , of course, the real reason TiFKAS is too chicken to go into mac.advocacy: thirty seconds after it opens its big yap and puts its foot in it, it''ll be reduced to a pile of onion rings by .advocacy's denizens. Indeed, one true Mac advocate there who's seen TiFKAS in action has advised it to buy a PC and mirrored glasses with the mirrors facing inward so that it can finish its metamorphosis into a Wintroll :)

TiFKAS will, as usual, deny all and start replying to his imaginary friend "Chunks". Dance for us, monkey boy.......

having just gotten my Handspring Visor Deluxe, I decided to see just what was out there in the way of programs, and particularly those E-Books out there.

well, I just happened to go onto the Aportis website (they make a document reader for Palm OS) and saw they have an E-book section.

Wouldn't you know it - someone has come up with an E-book History of Atari, from Syzergy to Hasbro, for free download! And it's pretty good, too. Lots of info and fun facts about Atari - did you know that they sold 350,000 copies of Tempest 2000 for the Jaguar? They also talk about the Atari computers, from the 8-bit to the Falcon

If you've got a Palm or compatible and want to check it out, go to http://www.aportis.com/library/index.html and click in the Computers section. You'll need an E-book reader to load and read it.

BTW, the Visor Deluxe is pretty good, too - they've just discontinued it, and so you should be able to grab ahold of one of these for a good

price. I got ahold of a refurbished one from the Handspring web site for
$119 US + free shipping. This thing has as much RAM as my TT does, and
it's turning out to be pretty useful for work-related stuff. Now I'm
getting ready to order a digital camera Springboard module for it :)

It's the truth. Epic thinks there is a future in the Amiga. Sounds
like ATARIUSERINDENIAL again.

What does Conrad Black have to do with Chretein being last of the
major world leader to visit down south? Sheesh, even the Japanese PM
was there before up north.

Sounds like you and Conrad share something...

Attack who? No beloved up north. I do have sinclap cousins and a
uncle up north.

no he got no life,  he lives in the basement (why he has no sex life) of his
parents house (which he has claimed is 300 miles south of china) spending his
time reading rush limbaughs latest diatribe and aspiring to be bill palmer.

Yes what I say is fact (ie truth).  The amiga has always had its adherants
who like its stronger features.  and unlike you most of them don't spew utter
bullshit at every oppurtunity.  Btw,  when are you gonna admit the real
reason you NEVER visit csma even though you claim to be a mac advocate and
"apple power rep"?

Nope sincrap,  you lose again.  You see we all know your a pathelogical liar and
an
outright jackass.  Nobody believes your crap, never have and never will.  The
truly
sad part of it is, you still fail to realize this while the rest of the universe
is
laughing at you.

Hi, First time I write to this NGs.

I gues this was asked too many times already, but here it is...

How to attach PC mouse to an STE.

I've even found an old 3-button mouse with a large serial connector to it, and ST software supposed to do the thing, but...

I plug the mouse into MODEM port, *.prg runs from a aUTO folder and....

Left and right buttons do work, but it won't follow the moves. Ocasionally a pointer will slide down and to the left, out of the screen. Reminded me of a bad cable thing, but ohm meter showed cable is o.K.

I don't have original ATARI mouse at all, but have the working body of something called "Beatle mouse" (only cable and the jack are missing). It has 8 pin connector inside, as oposed to original 9. If someone could give me a hint where to look for a pinout scheme of this mouse, that could be the easiest way.

Thank you.

The best way I know is to do what I am doing now and that is to use
Mario Becroft's PC serial Mouse adapter. I use it on my Hades to use a
Logitech mouse. Works great... Try this site for more information:

Looks like know one cares since there has been no follow up.

> having just gotten my Handspring Visor Deluxe, I decided to see just what was out there in the way of programs, and particularly those E-Books out there.

Have the Visor as well. The new Sony one with integrated MP3 playback plus awesome styling has begun to eat in Palm's and Handspring's donut

> well, I just happened to go onto the Aportis website (they make a document reader for Palm OS) and saw they have an E-book section.
>
> Wouldn't you know it - someone has come up with an E-book History of Atari, from Syzergy to Hasbro, for free download! And it's pretty good, too. Lots of info and fun facts about Atari - did you know that they sold 350,000 copies of Tempest 2000 for the Jaguar? They also talk about the Atari computers, from the 8-bit to the Falcon

Sure made your day did it not?

>   If you've got a Palm or compatible and want to check it out, go to

I advocate you cherish Atari history by bidding on my fresh and styling
Atari Super Pong console.

Very sweet. Simple game, maximum playbility.

It's on ebay. Item # 1282105090

Also Atari 2600 ("Darth Vader black" version), Atari 5200 w/carts, even an
odd item like Superman Spinball Pinball (looks and is a strange thing to
behold).

Anyone know the web site of that guy who will custom make a Atari 2600 cart
(text display)?

ironically, there has, TiFKAS. You just have been too stupid to look.

And speaking of stupid: it's spelled "no". More proof that no one in the Mac industry would hire such a drooling moron as you to represent them.

snip

"Advanced Technology"!! From Intel! That is a blatant falsehood :-)))

<further vasecotomising>

I think you are missing the point. Rolls Royce still make cars to a standard not to a price. Kit cars (usually VW based) are still available. I think a "kit computer" is a nice niche idea. I certainly subscribe to the idea behind it.

But it seems like that's how the hardware support comes about. It seems like you pretty much have to buy peripherals that have been out for about 3 years to get full support in Linux.

sigh

Which particular Linux "interface" are you referring to?

Free clue: Linux doesn't have any one single interface into which a web
browser can be integrated, unlike some other OSes. Similar things apply

to many Unix derivations/clones/flavours etc. Given the open-source GPL nature of the Linux, it would be nigh on impossible to integrate something in a manner such that it couldn't be unintegrated and, in many ways, Linux is essentially the kernel and helper apps. The interface is virtually entirely customisable, since all the kernel hooks are well documented and available to all.

And I answered your question with a real world answer. The US government, at least
does not now have that power. The only power they have to do anything like you
asked

is only if the corporation in question is a monopoly, and is using it's monopoly power
to extend or maintain it's monopoly.

Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for that),
and Linux isn't the product of a monopoly, there isn't a hypothetical to ask, unless
you first suggest that Congress passes a law that isn't even in question, and that the
President's veto isn't overridden, and that the Supreme's say is constitutional. That
isn't hypothetical, that's a chemical induced nightmare. ;-)

Monopoly does *not* mean that *everyone* uses your product. AT&T was a monopoly, even
though there were several other competitors (GT&T, IT&T, here in eastern Nebraska

there was LT&T, and so on), AT&T was a monopoly because they had a super majority of the business, and there was no way that any of the competitors could take the monopoly away from them.

Besides, your opinion doesn't count, and neither does mine. The trial court found that M$ *is* a monopoly, and the appeals courts sustained that decision.

c. 90% of computer desktops does equal a monopoly.

> Even, of all people, RMS has stated that everyone
> has a choice of what OS to use. A corporation is not a monopoly because
> the free will of the people chose one product over another.
>
> Case in point: IBM, you /could not/ built an IBM PC without an IBM PC
> BIOS, therefore IBM had complete /exclusive/ controll of the market,
> regardless of the purchasing decisions of the consumer. This is what a
> monopoly is.

LOL - no, not at all. Ever hear of Phoenix bios? Award Bios? Ever hear of Dell, Compaq, Tandy? They all made machines that were IBM compatible, and IBM long ago lost control of the market. How silly of you.

IBM's monopoly was in mainframes, and even there they had competition. But they used their monopoly power to squeeze the competition, which is why the Feds came down on them. IBM settled out of court. M$ isn't that smart.

>
>
> (By the way, we

We?

> broke that monopoly

Read the above. You don't have enough information here to debate this intelligently.

> by reverse engineering the BIOS,
> see? Kind of like the kerberos example. The court should do the same
> thing they did then, allow an implementation of that functionality to
> be duplicated.)
>
> Microsoft, on the other hand, was voted to where they are now by the
> purchasing decisions of the free willed people.

Not really. M$ makes their money on Office not Windows. And of course, not on Explorer. But Navigator was a threat to Widows as a platform on all OSes, and therefore a threat, in time to Office and M$'s monopoly.

So they cheated.

They did what was illegal for them to do at that stage.

> There are alternatives,

Oh yeah, GEOS is taking the world by storm, isn't it?
How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot,
Sears,
and Walmart have Linux pre installed on them? Have you seen ANY??

How many machines do you see in those stores that have applications software
(Works or
Office type) that are made by a competitor of M$? Have you seen ANY?

>
> for crying out loud Microsoft has one of the hardest competitors in the
> world to compete with, a competitor who /gives it away/ (sound
> familliar) and has both the popular and (arguably) technological
> advantage over them.

You don't have to have a monopoly in every niche to be a monopoly.
And Linux hasn't won even in these fields - yet. It certainly doesn't have a
monopoly
even in those niches.

> Not just in the OS market, but (especially) the

> distribute.

Adobe isn't selling an Office suite either are they?
Office is M$ bankroll.
By the way, how much do you hear about Novell and networking any more? A real
powerhouse like they were in the early 90's right?
And M$ often buys technology, that's not news. Nor does it have anything to do with
their having a monopoly in Office Suite or on Desktops.

Did you notice what happened to Stacker? Or After Dark? Products that aren't sold, in
part, because M$ bought such technology and incorporated into their software, so
consumers didn't need to buy and so didn't buy such products.

See, that's a real problem. If you get M$ Office for free, why would you buy
WordPerfect? If you get a screen saver for free, why buy After Dark? If you get a
browser for free, why buy one?

And when such actions are done by a monopolistic company, it's illegal.

Nice use of the cut and paste function.  Your technical knowledge is impressive.

You are still an idiot.

This one's easy (although I wouldn't say Red Hat "sucks")

 For starters lets take a look at the included version of GCC.

 Can you even recompile the base kernel with it?
```

I wouldn't say any OS sucks because of the "ease of installation"
because if the OS is worth it's salt, you're only going to install it
ONCE anyway.
 However, the compiler thing, I just have to sit back, shake my head and
wonder what WERE they thinking?

Easily, maybe, I can also easily unintegrate IE from Win98 too, there is
a way to do it ;) (Was quite an embarassment too, after MS said they
couldn't!)

In my personal opinion, I really hate the BSD license, for this very
reason. I mean, it's fine if you don't WANT to see your code when it's
reused, but I wouldn't choose it.

> That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code
> legally without releasing any changes they make back into the community.

Agreed.

> needlessly upgrade their software.

That's why I save everything in Word 6 format ;)

In the case of kerberos, they did publicise it, in fact, they publicised
the source code. While the NDA keeps you from using that source code, it
doesn't keep you from implementing the protocol.

LOL I love that line ;)

There are things in linux that it really is harder to do than in
Windows, but these things (like routing, wierd protocols like PPPoE)
are things usually done by someone who should probably spend a little
time learning anyway.

Sure linux has a learning curve, but it's a freaking computer, when did
the notion that computers had to be usable by people who didn't want to
learn anything become popular?

Hm? With the possible expection of SB Live!, my keyboard and mouse and disk drive (newer than three years, but the designs are not changed, I guess), there's no components that are even nearly three years old on my Linux box.

(Other hardware includes TB 1200, A7M266, Geforce 2mx, two IBM Deskstar HDs, HP 9120 CD burner and two NICs - all which is rather recent)

Didn't have a single problem with this configuration.

Then again, I'm not using USB stuff but rather more 'traditional' hardware.

The question (as posted in another article) had nothing to do with the
power they now have, but what power they should have, and why.

> Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for
that),
> and Linux isn't the product of a monopoly, there isn't a hypothetical to ask,

But the question was what if they were, saying "but they're not" changes
the question.

A monopoly means the consumer has no choice. As for AT&T, I never had a
choice. I can choose alternatives to Microsoft.

> Besides, your opinion doesn't count, and neither does mine. The trial court
found that
> M$ *is* a monopoly, and the appeals courts sustained that decision.

LOL, we are talking about opinions here. I don't pretend that anything I
say is going to be passed as law :)

That proves my point, the government didn't break them up, Phoenix made
a clean-room implementation of the BIOS, allowing machines to "truely"
be IBM compatible.

> IBM's monopoly was in mainframes, and even there they had competition. But they
used

Sorry, have a relative wo worked in the field, was kind of used to
hearing "we" ;)

> > broke that monopoly
>
> Read the above. You don't have enough information here to debate this
intelligently.

We're not debating technology, this discussion is about what benefits
the consumer.

;)

I'm sure you could think of an alternative if you tried.

> How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot,
Sears,
> and Walmart have Linux pre installed on them? Have you seen ANY??

I sell them. If you wanted one and can't find one I'm sure I could hook
you up.

> How many machines do you see in those stores that have applications software
(Works or
> Office type) that are made by a competitor of M$? Have you seen ANY?

Emachines come with StarOffice, and are sold at OfficeMax, among other
places. We offer Corell Office 2000 in addition to MS Office 2k, along
with StarOffice and a few others.

>
> You don't have to have a monopoly in every niche to be a monopoly.
> And Linux hasn't won even in these fields - yet. It certainly doesn't have a
monopoly
> even in those niches.

The problem is that "monopoly" is becoming too loosely a term. Microsoft
may be guilty of unfair marketing practices, but "monopoly" they are
not. There are choices, and the consumer can choose anything they want.

The governments role is *not* to protect other businesses from
microsoft, but to protect the *consumer*, and right now, the consumer
has choice. if the government happens to do something like pull a
product that the consumer WANTS, then the government is stepping on the
rights of the consumer in favor of the businesses that wern't chosen by
the consumer.

Adobe competes almost squarely with Microsoft Office in many areas.

 Pagemaker -> Publisher happens to come to mind.

> By the way, how much do you hear about Novell and networking any more? A real
> powerhouse like they were in the early 90's right?

This was mentioned in another post, they dropped the ball when Win95
came out. What happened to them was they rested on their laurels. They
failed to create a .VXD architecture based client for Windows,
overconfident in the believe the consumer wouldn't mind running the
legacy .386 architecture client. The same thing happened to After Dark,
which failed to rewrite their 16-bit code. This was not Microsofts
fault.

> And M$ often buys technology, that's not news. Nor does it have anything to do
with
> their having a monopoly in Office Suite or on Desktops.

But it does have to do with the misconception that they have "inside
knowledge," when there are many people with inside knowledge to the
Windows OS.

> Did you notice what happened to Stacker? Or After Dark? Products that aren't
sold, in
> part, because M$ bought such technology and incorporated into their software, so
> consumers didn't need to buy and so didn't buy such products.

Stacker was a dangerous product, as is any disk compression that is
filesystem based. They became irrelevant because HDD's became cheap. I
don't even USE compression on my drives, do you? After Dark was a legacy
application that insisted the consumer should be satisfied with a 16 bit
application in their 32 bit OS.

> See, that's a real problem. If you get M$ Office for free, why would you buy
> WordPerfect? If you get a screen saver for free, why buy After Dark? If you get
a
> browser for free, why buy one?

So the government should side with the small businesses over the
consumer? By that logic I suppose the government should ban TV news to
protect the newspapers which you must purchase.

Anyway *NOONE* gets MS Office for free, you might recieve it bundled
with a computer. but it's included in the price of the computer, it's

NOT free.

You don't think someone will buy a product just because they have one
that's free already? Why would anyone buy Windows then? Or the
newsreader I'm using now when I already have the MS one? When there is a
BETTER product, people will buy it.

This decision is best left to the consumer.

This right here is what I am thinking. A lot of other posts in this thread have talked about PC components. Come on people! PCs are no fun! We all like our obsolete computers (whether you consider them obsolete or not, I personally couldn't find anything useful to do on my Atari if I tried) right? We just want something a little more powerful so we can do all the things we need to do and throw out those stupid PCs which are just a bunch of parts sloppily thrown together. Even if there were an OS for PC that we liked it wouldn't matter much because PC hardware just sucks. Maybe you don't agree but this is certainly my opinion. I'm an assembly language person and I find C++ (the language that "everyone" uses now) to be completely unnatural. It isn't practical to program PCs in assembler because there is so much different hardware (can't find programming info for most of it either) and because most of it looks like it was designed by crazy people.

Sooo... I use my PCs for internet access, for games (just emulators and Doom network games actually), for playing music, the occasional school assignment, and for programming (for non-PC systems of course, like the Turbo Grafx 16 for which I've written half of an RPG in Hu6280 (like a 6502) assembly). One of the many things I like about my Atari is the fact the motherboard is not too dense, I can go in and unsolder stuff and solder other stuff on. There is no way to do that with a PC motherboard (at least on anything newer than a 286) because of all those tiny little pins on the chips and the four-layer construction. Taking all of this into account, my system would look like this:

1. nice, simple CPU (since I'm a fan of the 6502 I'd use one of those great Western Design Center 65816's. one of those eZ80s that I've heard about would be good I guess. 80x86 chips are out of the question of course), with a clock speed in the double digits (decimal digits, not hex :))

2. 2 MB or so of RAM would be fine for what I'm doing

3. A cool video chip like old computers had, that means something other than just a frame buffer and a DAC, something with sprites and layers and maybe polygons. I would like something with 256 colors at 640x480 (the V9990 chip used in the 3DO would be great, the chips from the later MSX computers would be OK)

4. A likewise sound chip, something with 16-bit stereo PCM but also with some good old FM channels or square waves or something

5. an EIDE interface

6. built-in ethernet

7. some REAL joystick ports (the kind where you read a register and each button is represented by a bit)

8. expansion slots

9. An OS which isn't bloated and slow, which includes a command line interface, and which isn't designed to protect idiot users from themselves

Perhaps within the next year or two, when I have some money and some time, I'll build something out of a 65816 development board. Then again, I might spend all my money on mods/paint for my BMW (which is around the same age as my Atari 8-bitter of course).

> Andy please elucidate on _WHAT_ sucks in Red Hat?

Everything. The entire user experience from start to finish. A few notable
points:

The installer *still* complains if you try and put a boot partition above 1024 cylinders and absolutely refuses to allow you to continue (unless you go with it's suggested partition arrangement in which case it just suggests that you don't do that[1]) despite being perfectly capable.

The hardware detection is pathetic compared to other distros. Even simple things like making some use of the Windows key which is on almost all keyboards these days isn't done for you.

The configuration tools are scattered all over the place, all work differently and most are quite counter-inituitive. The auto-update is rubbish compared with the Mandrake equivalent, requiring you to faff around with their website[2] and send them all the sorts of details that everyone was worried Microsoft would want from you when they thought up Windows Update.

Need I continue?

AndyC

[1] And what the f*ck is the point in "recommending" a partition arrangement if you are then going to announce that it isn't recommended.
[2] Which, stupidly enough, only seems to work properly in Internet Explorer under Windows.

Indeed. Of course the trouble with the Linux community is that they just aren't devious enough. They should've taken Kerberos, added their own proprietary extensions and then released them under the GPL.

Hmmm, where's my compiler gone...

Not in the real world.

A choice can still be available when a company is monopolistic - like
Microsoft, for instance. And most users *didn't* get a choice, because
of the licensing agreements with major PC manufacturers which is how a
lot of people buy hardware.

I didn't mean to say that you *had* to have old hardware, but I guess it
came out that way. What I meant was that if you have a PC that was

built with no consideration for Linux, you can't reasonably expect all
you peripherals to be fully supported should you decide to install Linux
on it, if the peripherals are relatively new (not the actual cards, but
the chipsets or firmware used).

Yes, I read the comment pretty much as "no new hardware is supported
by Linux; the support comes only later if at all" ;)

It seems to depend quite a lot about the manufacturer; eg. nVidia and
3Com seem to have rather quick support for Linux, whereas some
companies seem to be a real pain in the ass with support lagging years
or infinitely.

Why buy a $300 NEW computer when for that amount of money you could get a very good USED computer? If you added an office suite, a VGA monitor connector and a printer to the Sega Dreamcast (which already has a browser, modem and keyboard available), there's a cheap combo with great games!

A decade from now $300 may be the standard price for a computer with relatively new technology, but the price today is more like $800-1000.

Realistically, you would have to be able to produce a $300 machine for about $50-70 to count in all the other costs, like shipping and returns, so someone would have to think outside the box, so to speak, to get the job done.

I do NOT think a monitor should be included with it. It adds weight and cost. You go to a thrift store and there are lots of monitors there. People also have TVs. The computer should have connections for at least types of monitors: SVGA, RCA and AV for TV/VCR. People can get whatever type of monitor they want.

I also think the day of the all-in-one desktop unit (the Apple IIc, Atari 800, Commodore 64 etc.) should be revived if one wants to be economical. Have a serial printer port, joystick/mouse port, the aforementioned three monitor/TV ports, SCSI port. Built in would be a 33k modem and 3.5 floppy drive for data storage. I wouldn't include CD-Rom. All the necessary stuff should be pre-installed to make life easy.

There would have to be a GUI. Something tight that doesn't slow down the new user. HD let's peg at 1GB and Ram at 64MB and figure the processor is 333 MHZ -- good enought to make the Net move but cheap by today's standards. The builder should work a deal with Lotus or WordPerfect to put a low-priced office suite on here.

These $300 machine won't compete speedwise with their $800 counterparts, but are GOOD ENOUGH for most users. And as the $800 machines get faster/better, so will the $300 machines due to trickle-down technology. Perhaps they will be five years behind the more expensive machines in bits and bytes.

That's my biz plan.

:) We're talking about Microsoft, and you can use Microsoft as your
example of precidence? "Microsoft can be a monopololy even though there
are choices, take Microsoft for instance?"

> And most users *didn't* get a choice, because
> of the licensing agreements with major PC manufacturers which is how a
> lot of people buy hardware.

They chose to buy a PC with Windows on it, they had a choice. If anyone
here can find me a PC they want, and they don't want Windows on it, I
guarantee I can find it somewhere else, with the same warranty, support,
and hardware, at the same price, with another OS on it.

Even during the time when Microsoft had exclusive licensing clauses
(ended around 1993) there were options. I mean, heck, look at this
newsgroup.

Do you really think that everyone with windows on their computer was
forced to use it? I guarantee if you take a poll and ask people buying
new machines, and ask them what OS they want on their new PC, it will be
Windows. The people who want something else will buy a machine without
Windows. (Personally I've never purchased Windows, but I get developer
versions via MSDN, and beta versions like the XP I'm using now)

Here's the real world situation. Microsoft can't touch Apache with IIS in any of it's incarnations, and it doesn't look like that will change, despite the fact they'll give it to you FREE with Server, and Mindcraft say's it's faster and scales better.

On top of that, after stating "opensource is a virus" Microsoft has egg on their face because they just cant for the life of them get hotmail to work without good old BSD holding the fort, and this is at a time when they're pimping their platform for .Net.

There are Free alternatives to all of Microsoft's products, and ones in developement for products Microsoft hasn't even released yet! Miguel's already pimpin' Mono to work with .Net.

Microsoft's days are numbered, they see the writing on the wall, they know they can't compete with a competitor that they can't buy, undersell, influence, or lock out of the market. The government stepping in right now, would just stop the inertia at a time when they're not needed anyway, they'd take the credit for the inevitable.

Monopoly or not aside, the governments role is to protect the consumer and ensure the consumer has choice. The government's role is NOT to leverage consumer choice for the benefit of Microsoft's competitors. If competitors are cutting each others throats giving away free software, and as the dust settles, the consumer has free software, and netscape's dead, the consumer has benefitted. What then, would the consumer benefit from the government flexing its arms at Microsoft on behalf of these businesses who lost the war to the benefit of the consumer? That's supposed to be how the Monopoly law works, to benefit, for, and ONLY, the consumer.

So where has the consumer lost? The consumer has both Netscape, AND IE, both free, and without the government stepping in where it would have hurt the consumer to do so.

The fact remains, Netscape is just as available as it's always been, if not more so. From the consumers point of view, the consumer has won. From Netscapes point of view, they are legally entitled to financial damages, but they are NOT entitled to having the customers choice overruled by the government on Netscapes behalf.

This isn't really anything more than a political issue I believe, I think this discussion is between the chairs on the left and the chairs on the right. :)

I think you're right. And when AOL became popular, and computers started being sold in designer colors. :)

>I think you are missing the point.

Not at all. The "point" was to try to make a "new" computer for $300.

MY point is that NO ONE WILL BUY ONE if it has half the features and
runs at one tenth the speed of a comparably priced system ALREADY on
the market.

> Rolls Royce still make cars to a standard
>not to a price. Kit cars (usually VW based) are still available.

And Rolls Royce has been in financial trouble for quite a while now.

And "kit cars" cost a ton of money, and hardly ever work right.

You can ride to the Space Station if you have enough millions.

But can you build an obsolete hackers' computer for only $300?

> I think a "kit
>computer" is a nice niche idea. I certainly subscribe to the idea behind it.

Certainly, you can find something to fill almost any niche, if price
is no object.

I always lusted after a KIM-1, even though it cost more than our $300
price point, and did very little.   Want to guess how many were
actually sold?

For the last year, I have been looking for a copy of the book: Zap! The rise and fall of Atari by Scott Cohen. It has been almost impossible to find....until two weeks ago. I was on Amazon.com and found two used copies....yes...but they wanted 97.50 and 172.50 for them. I want the book.....but not that bad. Well...to cut the story short, I found this Web site that will make you a copy of the book...yes..they actually make it when you order it...for $16 bucks. Keep in mind, its not the original...but a copy of the book. The girl I talked to there said that they have agreements with authors to re-publish their work...without the author having to invest thousands of dollars to have multiple copies made. She said that they make the book when a customer orders one. I assume that Scott realized there still was a demand for this book.....so he used this firm to get it back in the market. Get your copy today!!!

Well the users have always had a choice, simply to drop the OEM version of Windows and pay extra for the retail version. The vendors and dealers were just never any good at informing the consumers.

Who are to blame, really?

Regards...

That is a pretty strong guarantee. could you make the other OS 'geos'? And
no that is _not_ a typo. or hey let's call dell and see if they will
preload QNX?

> Even during the time when Microsoft had exclusive licensing clauses
> (ended around 1993) there were options. I mean, heck, look at this
> newsgroup.
>
And that is another point. every so often a newbie comes in and asks about
this newsgroup(writting from alt.amiga.*), should they get interested in
Amiga and the answer is invarible, not unless your in it for nostalgia.
The stopped making them because they could not sell enough units. although
my personal feeling is that M$ did not kill the Amiga but only handed them
the knife.

I think if you take a poll on new PC owners they would not know what an OS
was you would be more likely to get the answer Word.
As far as experienced PC owners, what non-commercial OS are they going to
ask for? I mean Really, Red-hat is not yet buying ad space in Time,
newsweek, or insert-your-favorite-non-Linux-publication-here.

They seem to be doing a pretty good job, and 'Code Red' virus seems to be
proving it. But with several companies buying into the 'technology
partner' status, and '.net' strategy, it seems to be Microsoft || die.

Last time I checked(recently), hotmail was running windows 2000 on IIS.
Yeah shocked me too. I was doublechecking it for accuracy and according to
the website I used(I think it was netcraft) they were no longer FreeBSD.
Which the NT-vs-Linux.org site needs to be updated cause that is the link
I _was_ referencing in conversations.

Microsoft is not dead, possibly dying but I don't think so. They have very
low overhead for the units they sell. Nobody is going to unseat them, I
offer the following quote from an advert in the paper..."Please send your
resume in word doc format." When your the standard the other guy has to be
twice as good to unseat you.

> Monopoly or not aside, the governments role is to protect the consumer

> the consumer.
>

See comment about Geos above. When I was consulting, 10 years ago, Geos
was considered by some to be "better" than windows. For 3.10 that was not
a huge challenge. But it's dead now and the company's only claim to fame is
a (silly)patent on WAP. Is the consumer protected by geos' inexistance?
Was Microsoft the first company to produce a software product called
internet explorer? what happened to that company?
Was the lesson of geos, and the company who originally owned the
copyright to the name to "internet explorer" as a program a benefit to the
consumer?

> So where has the consumer lost? The consumer has both Netscape, AND IE,

It wasn't that MSIE was free, it was that you couldn't get windows without
it. It would be like firestone striking a deal with Ford that you couldn't
get a shiny new (ford)SUV without firestone tires on it.

> This isn't really anything more than a political issue I believe, I
> think this discussion is between the chairs on the left and the chairs
> on the right. :)
>

I guess you must be sitting on the right, because I know I am on the left.
oddly enough I am a Microsoft user, but only the OS. You see I bought the

OS because it came preinstalled on my machine before I knew about your gaurantee. I don't have the office suite because I don't have the $450 to buy the non-upgrade copy. (oddly enough though the Corel office competing product is only $100, why is that?) I am writing this from a Linux box on a telnet session because the emulation is better.<rant />   Matt

: the market.

Bob, you are missing the point. The point is to play with an idea. The underlying question is: if we could create our own computer, how would be build it? The price point is there so that we don't build something, like a quad processor Pentium IV, or what be it.

It does not matter whether this machine will sell, because it is only an idea. Sometimes ideas are good, and sometimes ideas are bad. There is no sole judge of quality and, if there were, it certainly wouldn't be on marketability. In this day in age, the Apple II, Amstrad, Amiga, and Atari have very limited markets. That does not mean that these machines were bad ideas. It certainly does not mean that we who use them have bad ideas.

And even if sales were an issue, I'm sick and tired of this damn "you must own the market to be successful" mentality. To pick on Commodore and Atari: these companies were split up, sold off, and bought by other firms. Does that mean that the Amiga or Atari ST were unsuccessful. Apple's marketshare is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that Apple is a failure? Apple is almost 25 years old. Is Sun a failure, by the same logic? Of course not. It is absurd. If I can make a living while serving a few hundred clients, I would consider myself a success. If I could do that with my 68k proposal. And, as I pointed out, similar machines which are targeted to a limited market already exist in the sub-$300 price range.

Yes, 68k and Z80 based computers are still made. A tenth of the power? Heck, I'll bet that the 68000 is a lot slower than that. Ditto for the Z80 based machines.

The point is: these machines are not targeted at the same market that Windows, or MacOS, or any other entertainment/office platform is targeted at. The TI-89 is designed as a calculator, and the design is directed towards portability and the entry of mathematical expressions. But don't be fooled, this is a computer as powerful as an Atari ST. It is routinely programmed to serve other purposes (assembly, C cross compilers, etc.).

Does TI sell millions of '89s every year? That is doubtful. They offer about a half a dozen different models (again, some are Z80 based and are just as programmable). HP is probably their biggest competitor, in a similarly small market -- and there are others. Are any of these companies or product lines a failure as a result.

If you want to by your dime-a-million VCR's and Wintel computers, be my guest. If you think that our discussions are illconceived, so be it. But if you are more interested in tearing our designs apart than contributing construtively, I suggest you shut your mouth, add this thread to your kill file, and forget this little band of crazies exist.

Good night, and thanks for puting me in a foul mood,
Byron.

Actually, I don't think Microsoft had anything to do with it, Commodore
couldn't market pardons in prison. They had a bad habit of marketing to
customers they already had, or "preaching to the choir."

;)

Most of our customers ask for Windows 2000, thinking it's 98's next
version. Then they ask about the Millenium version, so we tell them that
it's WinME they're thinking of. The ones who don't ask about the OS just
assume that Windows "comes with" their computer, they also assume
MSOffice comes with it also.
 Then we hit them with the price. Win98/ME $99 installed, Linux, your
choice of distro, $50 installed.
 Some ask, "what do you mean installed?", We respond, "that means we
install it" (as if the HDD was manufactured with an OS on it, sheesh).
 "But Gateway doesn't charge for that!", "Yes they do, it's built into
the price they're charging you for the OS, we're not charging you extra,
we're giving you the option of not paying for something you may not
want"

> As far as experienced PC owners, what non-commercial OS are they going to
> ask for? I mean Really, Red-hat is not yet buying ad space in Time,
> newsweek, or insert-your-favorite-non-Linux-publication-here.

Red Hat /is/ a commercial OS, and an "expierenced PC owner" has I'm sure
been flooded with information and hype et al about linux, including from
such sources as... Time, Newsweek, insert just about any major PC
magazine here. In fact, didn't Time do a huge article about Linus and
name him one of the "people to watch" right under (or was it above) Bill
Gates?

;) I don't know if we can look at virus proliferation as a sign of
Microsoft dominance, but it's a funny thought. ;)
I remember several people talking about the P3-unique ID the way some
talk about .net. We'll see how many die from lack of .net.

> > On top of that, after stating "opensource is a virus" Microsoft has egg

> Which the NT-vs-Linux.org site needs to be updated cause that is the link
> I _was_ referencing in conversations.

If you used Netcraft to check their servers, you were seeing a straw
man. You'll notice a few weeks ago netcraft identifies them sometimes as
"BSD" sometimes as "2000" and I even saw a "???" listed, MS is playing
games putting an "airgap firewall" up. (which by the way, is actually
good security practice, my firewall is linux, but it reports itself as
NT4 :) It's harder to hack if you don't know what you're hacking)
 But Microsoft has recently stated that they were using BSD, and that
the transition would be gradual so as not to effect the user. This has
been going on for a while now.

You don't have to unseat Microsoft, and they don't have to die, they will simply become less relevant over time, Like the term "Word Doc" is less relevant now, since like Kleenex, many Word Processors can save to Word Document format. Sometimes common usage is a bad thing for the trademark holder, it can be a sign of evaporating relevance.

> > Monopoly or not aside, the governments role is to protect the consumer and ensure the consumer has choice. The government's role is NOT to leverage consumer choice for the benefit of Microsoft's competitors. If competitors are cutting each others throats giving away free software, and as the dust settles, the consumer has free software, and netscape's dead, the consumer has benefitted. What then, would the consumer benefit from the government flexing its arms at Microsoft on behalf of these businesses who lost the war to the benefit of the consumer? That's supposed to be how the Monopoly law works, to benefit, for, and ONLY, the consumer.
> >
> See comment about Geos above. When I was consulting, 10 years ago, Geos was considered by some to be "better" than windows. For 3.10 that was not a huge challenge. But it's dead now and the company's only claim to fame is a (silly)patent on WAP. Is the consumer protected by geos' inexistance?

Geos still exists. They simply renamed themselves "New Deal Office" and are marketed at Doorstop-technology machines, like old 486's. They wern't squeezed out of the market, they chose a niche, that they are currently filling.

> Was Microsoft the first company to produce a software product called internet explorer? what happened to that company?

They sold their rights.

> Was the lesson of geos, and the company who originally owned the copyright to the name to "internet explorer" as a program a benefit to the consumer?

Considering the consumer gets it free? How is that not a benefit? The consumer also gets the competitors product free also. I can't think of a way that the consumer has lost, can you? And guess what? there's more! If you have a hankering for something different, there's Arachne for DOS (free) and Opera for Windows, get this, selling their browser, in spite of Netscape and IE being free. You know why, they built a browser that suits the needs of some people who are willing to buy it where as the free ones didn't. (actually tried Opera, didn't like the MDI-windowed interface, but it was fast!)

I hate to break it to the Netscape people, but netscape was a pain in the ass quite often, up untill V6 anyway, 6 looks good. (Why couldn't Mozilla use 6's interface instead of that legacy 4.7 crap?)

> > So where has the consumer lost? The consumer has both Netscape, AND IE,
> > both free, and without the government stepping in where it would have
> > hurt the consumer to do so.
> >
> Without AOL would netscape 6 even exist?

Probably not, or at least it wouldn't be as good as it is now. The same,
however, can be said for IE. Would IE exist, as it does now, if not for
Microsoft?

> > The fact remains, Netscape is just as available as it's always been, if

> It wasn't that MSIE was free, it was that you couldn't get windows without
> it. It would be like firestone striking a deal with Ford that you couldn't
> get a shiny new (ford)SUV without firestone tires on it.

But if they decided to give you the tires for free, to keep, and you had
the choice to take that money and buy your own tires, in addition to
keeping the firestones, well,hey!

> buy the non-upgrade copy. (oddly enough though the Corel office competing
> product is only $100, why is that?)

Demand.

You should have bought the PC from someone who could have sold you an
OEM MSOffice. (well, assuming you bought them at the same time anyway)

Here's a tidbit, we make more selling Correl Office Suite than we do MS
Office. Last time I ordered Corel (OEM version mind you, but the whole
Office Suite) it was $14 my cost, we sell it for $95 installed, with
correl Office ServicePack3 patched and all. Should be a National Average
price, since I had to get it from Ingram Micro.

> I am writing this from a Linux box on
> a telnet session because the emulation is better.<rant />   Matt

Writing this from Microplanet Gravity on WinXP RC12505 (gettin RC2 tommorrow!) Microsoft's newsreaders suck. It's worth the price for Gravity. (I just didn't care for Agent, it felt like a 16bit app, just me?)

And where, pray tell, would you get, for example, a Dell Precision (complete with cool case, quirky motherboard arrangement and proprietary power supply) preloaded with QNX?

Or did you mean "I can find something a bit like it somewhere else"?

AndyC

I think the biggest reason for this is that most of the people (not the technogeeks like most of us here in these newsgroups) simply don't know about the alternatives. Your average computer user will most likely get their new overpriced system at one of the big retail chains such as Circuit City, or Fred Meyer, or whatever. When they walk into one of those places and look over the selections, they will see the stats on the display models, and it will most likely list some form of Windows, some form of MS-Office, and probably a trial subscription to MSN or AOHell (in addition to listing the hardware of course). At those mass-market chains, you never see systems with stats placards boasting Linux and Star-Office. And the sales rep most likely won't even consider mentioning those as a possibility (if he even knows what Linux is).

As an example, only about 2 years ago, I was at the Base Exchange at McChord AFB, and was looking over the different computers in their electronics department. I asked the sales rep there if I would be able to buy one of their systems without any OS installed, since I was scouting out a system to become a Linux box). He just flat out refused. I don't remember the reason he gave, but if I wanted one of their computers for my Linux system, I would have to get it with Windows-98 preinstalled, which I wouldn't have been using anyway, so why would I want to pay extra for it?), reformat, and then do my Linux install.

So, to cut this post short, since I nearly lost my train of thought here... What good is having choices in operating systems and other software packages, if the typical consumer doesn't know about those choices and the folks selling the systems won't volunteer that information?

How is it done? I'd like to give it a try on one of my experimental
systems I'm always tinkering with. :)

>Bob, you are missing the point.

Actually that's not entirely true.

This thread has split into several directions from the original question of what a $300 "home computer" would look like.

Some of the threads I've stayed out of, since I really don't have any experience with the esoteric CPUs that have been proposed (other than knowing that they ARE esoteric).

Other threads have pointed out that successful, well appointed $300 computers already do exist, with no necessity of leaving out CD-ROM drives or I/O ports as the original post suggested. Those I've participated in, my response was one of the first ones actually, with the comment that I just bought a very nice, new PC for less than the suggested $300 price point, with nothing left out to cut corners.

More threads have questioned what the potential market for the proposed new system would be. This is where my questions about the marketability of a system like this have fallen.   Unless the proposed audience is only the handful of people participating in this discussion, then the question of the market for any product has to be addressed.

(Yes, I know this is all hypothetical, but it's still a valid question)

> The point is to play with an idea. The
>underlying question is: if we could create our own computer, how would be
>build it? The price point is there so that we don't build something, like
>a quad processor Pentium IV, or what be it.
>

Oh, I'm very familiar with the idea of kicking around concepts- the question comes up on a regular basis in the Atari newsgroups. It's usually phrased something like "What CPU would you like to see in a new Atari ST clone?"   And it goes back and forth, much like a lot of this discussion has, with no one really ever believing it really could happen, but it's just fun to talk about.

>It does not matter whether this machine will sell, because it is only an idea. Sometimes ideas are good, and sometimes ideas are bad. There is no sole judge of quality and, if there were, it certainly wouldn't be on marketability.

Well, the original post presented the idea with a definite slant toward the marketability question.

Why propose leaving out such features as a CD-ROM drive to cut corners down to the $300 point if marketability wasn't an issue?

The original question was presented as if a new "hackers" computer might be a viable product, if only the cost could be contained to a reasonable level, similar to the "good old" machines we used to tinker with.

>In this day in age, the Apple II, Amstrad, Amiga, and Atari have very limited markets.

I would say they have ZERO market, but there are those among us who might get upset at that.

People still buy wax cylinders for Edison phonographs but that doesn't mean there's a viable market for them.

>That does not mean that these machines were bad ideas. It certainly does not mean that we who use them have bad ideas.
>

Definitely not.   The current situation (for anything) doesn't change the history attached to anything.

The Apple computer was groundbreaking. It brought commercial success to the brand new microcomputer world truly for the first time. All the earlier attempts were close, but no cigar.

Atari was the most technologically advanced computer of its time. It's coprocessor chip set was far and away better than anything available when it came out.   The fact that Atari, Inc, and Atari Corp couldn't figure out what to do with it doesn't take anything away from the computer itself.

The Commodore 64 was THE most successful microcomputer of ITS day. It was the best selling computer in the entire world, at that time.

The TRS-80 was a solid, well marketed system. It was headed in the right direction with its business applications. You could buy one in a million Radio Shacks.

All of these were good ideas, at the time.

You'd have to be crazy to try to sell any one of them now.

>And even if sales were an issue, I'm sick and tired of this damn "you must
>own the market to be successful" mentality.

"Owning the market" is an unusual situation. Generally there are several competitors, each with its own market share.

The auto industry has many players, but they all provide a "standardized platform". When you buy a car, you get the same four wheels, the same steering configuration, much the same control mechanism. There are variations, of course, but the basic product is built around a standardized platform.

The computer industry has standardized on a platform as well.

> To pick on Commodore and Atari:
>these companies were split up, sold off, and bought by other firms. Does
>that mean that the Amiga or Atari ST were unsuccessful.

Those are not the reasons why the Amiga and ST were unsuccessful, they are the result of the products being unsuccessful. The companies might have survived if the products had been successful and had sold well.

> Apple's marketshare
>is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that
>Apple is a failure? Apple is almost 25 years old.

That makes Apple far more of a success than any of the other companies mentioned. Those other companies are all dead.

Simply by surviving for 25 years, Apple has succeeded.

Apple does that by selling products people want to buy. They've had failures, sure, but they generally learn from them and bring out other products that are more successful.

> Is Sun a failure, by the
>same logic? Of course not.

Sun has a very good position in its chosen marketplace. It too sells products people want to buy for their specialized needs. In that respect, Sun is very successful in its market.

> It is absurd. If I can make a living while
>serving a few hundred clients, I would consider myself a success. If I could
>do that with my 68k proposal. And, as I pointed out, similar machines which
>are targeted to a limited market already exist in the sub-$300 price range.
>
>Yes, 68k and Z80 based computers are still made. A tenth of the power?
>Heck, I'll bet that the 68000 is a lot slower than that. Ditto for the Z80

>just as programmable). HP is probably their biggest competitor, in a
>similarly small market -- and there are others. Are any of these companies
>or product lines a failure as a result.

The definition of success or failure depends on many things. Obviously both TI and HP consider some of their products to be successful since they continue to sell them and to introduce more models. Other products are dropped from the product mix.

One thing you can be sure of though, if no one bought a TI calculator model, it wouldn't last long in the marketplace.

It wouldn't matter what features it had, or what CPU it was running, or how loyal the people who might have bought one felt about it. If it didn't sell, it would be dropped.

And they certainly wouldn't introduce a new model unless they felt it WOULD sell, and they had researched the marketplace to be sure.

My questions about the intended market for the "$300 Hackers' Computer" are along the same lines.
>
>If you want to by your dime-a-million VCR's and Wintel computers, be my
>guest. If you think that our discussions are illconceived, so be it. But
>if you are more interested in tearing our designs apart than contributing
>construtively, I suggest you shut your mouth, add this thread to your kill
>file, and forget this little band of crazies exist.

Like I said, discussions like this can be interesting and can expose a lot of people to concepts they might not have thought of otherwise.

But part of discussing what might make a successful new computer has to be a discussion of what made earlier attempts fail.

As much as I loved my Atari 800, I know why it disappeared from the stores, and why my Commodore 64 fell from being the most successful computer in the world to a $5 thrift store white elephant. And, I know why the other computers I have now have succeeded.

>
>Good night, and thanks for puting me in a foul mood,
>Byron.

Sorry about that- unfortunately that's sometimes part of being "devil's advocate".

BobR

Getting even farther from the original topic. It is quite easy to have a "kit" computer for next to nothing. Here's my current little kit project...

http://www.oz.net/~otter/gallery/Thissle.JPG

This is eventually going to be a dual-boot Linux/Winblows-98 beast. Here is what Thissle currently has:

ISA/PCI motherboard
Intel Pentium-120 CPU (Socket-7)
40 MB RAM (72 pin SIMMs - 4 8MB SIMMS and 2 4MB SIMMs)
256K Cache
Hard Drives:

IDE x4	Quantum Fireball ST3.2	3.2GB
	Western Digital AC-2850H	850MB
	Maxtor 71260AT	1.2GB
	Fujitsu M1636TAU	1.2GB
SCSI	Quantum ProDrive LP240S	245MB

CD-ROM Chinon CDS-53S
Colorado-250 Tape Backup Unit
Standard 3.5" HD Floppy Drive
Trident TGUI-9680 PCI Video Card - 2MB
56K Modem - ISA
AMD AM-2100 NIC Card - ISA
Adaptec AHA-152- SCSI Card - ISA
SB-16 PnP - ISA
Nice SVGA PnP monitor
Typical 2 Serial Ports and 1 Parallel Port
She still has 2 empty PCI Slots

Right now, I'm just messing around with her Win-98 side, mostly for hardware testing, and for teaching myself networking. The Network hub sitting next to her will be used to link her and SunBlossom (the P-166 system I'm posting this from) together, as soon as I find the documentation for the hub.

All total, I think I have at the most $25 to $30 invested in her. The majority of her components were given to me from friends and co-workers who know I like this old stuff, with the rest being purchased from thrift stores.

I think this definitely qualifies as a "kit" computer, or at least as a "geek station". :) She's got enough to be operational, with plenty of room for upgrades and expansion as super cheap components become available.

Now as for the original question that started this whole thread...I'll have to think on that. Should make good bathtime thinking material later today; or goo drifting off to sleep thinking fodder. On that note, it's time for me to get some sleep.

Night all.

Maybe I should have left more context in, because I'm trying to figure out your implication.

My recollection was that the KIM-1 was a popular computer, though at a time when popular didn't have to mean a large quantity. At the time it was sold, it was still early in the cycle of small computers. People were still wanting computers because they had always wanted a computer (something a few years before was an impossibility for most), rather than because they had a need to do something with a computer. So the low cost, for the time, was to many more significant than the fact that it lacked memory, etc. In fact, the KIM-1 wasn't all that limited for the time, remember the Altair came with something liek 256 bytes of memory. To get a computer "that did something" you'd have to spend considerably more.

And of course, some people took their KIM-1's and made them into full-blown systems, with video boards or dumb terminals, 32K of memory, disk drives, and all kinds of things.

I have a KIM-1, got it in 1979 (late for the time, but clearly
way before most people got computers), so I'm biased. But my
impression is that the KIM-1 was an influential system,
coming between the S-100 systems that started it all, and
the all in ones that came in 1977, like the Apple and the Radio
Shack.

And now I'm really curious about your impression of how many
KIM-1's were sold.

   Michael

Agreed.

>And "kit cars" cost a ton of money, and hardly ever work right.

This is true only if you are not mechanic enough to assemble it correctly. For example, A hopped up Myers Manx could beat $25,000 or $30,000 Italian sports cars on the race track back in it's day. In 1968 a $30,000 car was _supposed_ to be a lot of car. (But seldom really was.)

And, a kit computer is worthless only if you lack the ability to assemble it.

>You can ride to the Space Station if you have enough millions.

I hope my new program for picking lottery numbers works!

>But can you build an obsolete hackers' computer for only $300?

You can buy an obsolete hacker's computer Goodwill or some other thrift store for a lot less than that.

BTW, I am posting this from a Windows box, but still enjoy just fooling
around with an old 8-bit computer almost every day.

Best regards,

Just who is this $300 computer being buildt for?
some geek who likes 3" thick manuals about command lines
or who wants to play with electronics?
or is it for the people who can not afford the fancy computers
if its for the last you have to make the OS  simple along the lines of Mac
or Geos or you will not sale many if its hard to use. and your stockholders
with not be happy.

so you are thinking about something like the Classic or tandys TOS
that would start from ROM?

>

The simple answer is that there was nothing else available and very little was available for what WAS available.

There was nothing that would run a competent word processor or spreadsheet, or play a photorealistic game, or render in 16 million colors, or typeset a page layout, or sort and relate a million entry database.

If you wanted something other than what you could buy from the back of Compute's Gazette, you had to learn to program and write it yourself.

There weren't stores like CompUSA where you could just buy the program and get on with whatever it was you wanted to do.

You HAD to figure out how to POKE graphics to the screen, or VARPRT to find out where your string variables were stored.

When I bought my first computer (an even older fart), an OSI C1P, I wanted to play games on it.   I bought game programs and ended up HAVING to learn to program to fix the bugs in the "commercial" programs.   I had to learn the "guts" of the computer to figure out how to add sound to the games since the manufacturer had designed sound into the system but not implemented it.

Sure it was fun, and sure I learned a lot, and actually made some money with it, and yes indeed, I wouldn't have missed it for anything.

But it wasn't what I'd originally wanted to DO with "a computer".

Now, you don't need a soldering iron or disassembler to do what you want a computer to DO.   In most cases, you just get the software and DO it.

Not everyone wanted to "tinker" with a computer. Computers didn't really "take off" until they became capable enough that you DIDN'T have to tinker with them to get them to do something.

That doesn't help the "tinkerers" very much, I know, but that's the main reason things are different today than they were when 8-bit computers were the only thing available.

That's actually what the original intent of this huge message thread
was, to provide a "new" version of the machines we used to tinker
with.

Sorry, but what has that got to do with ATARI? This is an ATARI Newsgroup
and any other subject SHOULD NOT be discussed here.

If you've crossposted your message over one or more other newgroups then
this SHOULD ALSO NOT be done, because THIS WASTES BANDWIDTH for everyone
else.

Sorry but it's about time that someone took a stand on this.

Cheers!

James

Kind of...  motorola rate their Coldfire 90mhz to consume .95watt. That seem alot
compared to
mobile pentium3 running at 10x the mhz. I dont think their is any >200mhz
Coldfire...

> long, long time, if ever.

My point was that the existing software base will not look as good in a decade, let alone decades.

> Go to the local CompUSA and check out how much shelf space is devoted
> to native Linux apps.

Oh, yes, I'll just pop over the Atlantic in my private jet and have a look.

Clue: The USA is not "the world"

Chris

Lol ;) We had this same war almost exactly 1 year ago! It's similar to
Goddards Law! (Godwin?) First, someone will point out the origins of
specific technological advances, then we'll rebut with 'but he was
/born/ in country /y/ so /x/ doesn't get the credit!'

Then someone will say Americans are all fat and eat at McDonalds, then
someone will rebut with Europeans have teeth that look like dice.

You know it's going to happen, the bloods in the water, the sharks will
come. :)

Sigh... the software base for the existing Operating System is the
point.

The point is that the Operating System a decade from now will likely
be the same, or a derivation of the current Operating System, so the
software base a decade from now will likely be the same software base
as it is now, with incremental changes, not radical shifts in support
for "other" Operating Systems.

Oh, that's certainly the point of this discussion.

OK then, CompUK, or Future Shop, or whatever.

<snicker> "CompUK" has a funny ring to it :)

Well see what the justice department says about the future of the
platform :)

Hopefully they'll take they're head outa theyre arse and leave them
alone, I want to see how Darwinism treats Microsoft.

SNL had one of their best commercial spoof featuring Mike Meyer  doing an
add for a British touthpast made from real sugar...
At one point he said: "You dont need to brush your teeth every week, but you might
just want to"
Or something in those lines.

Off topic? oh well...

Stephan

<snicker> When bitchin' about ones grammer, you should spell check your reply. :-)

in the term "outa theyre arse" how come you didn't point out the other two words? "out of their ass" , happy? :-) Actually though the spell checker came up and I apathetically just kept clicking change. (a likely story :)

> Last I heard, they were threatening to not let MS release XP...

That would just suck. (not that I'm a huge fan of Microsoft)

How will we ever find out if we can make an OS that's better than Windows if the government steps in?

I think this should be handled differently. Did Microsoft illegally kill DR-Dos? the court thinks so? ok, then award damages, move on.

Did they kill Netscape, the court thinks so? award damages.

are they crippling Kerberos? the court thinks so? make them open the documentation to the proprietary extensions, move on.

Can the US government keep M$ from selling XP overseas? now that would be interesting if M$ just said, "OK", and then kept selling 2k to the US and XP to the rest of the world.

The only thing worse than Microsoft dictating what software we have available to use, is the government doing it.

This hurts the Linux crowd too, if you think about it. We're working our asses off to get the government to understand that source code is a form of speech protected by the first ammendment, hoping to overturn the DMCA, and this just works against it.

There are alternatives to Microsoft, Microsoft is not a monopoly, everyone just uses windows, there's a slight difference. We could use linux couldn't we? What about the Mac?

It's not Microsoft's fault everyone isn't using something else instead, so far Windows has no competition only because noone is competing. There are alternatives, and they're developing. let the market work it out for itself. Maybe Linux will catch up and bury Microsoft. I'd rather see this happen than see XP banned, or Microsoft split up.

What would the government do to Linux if Linux had "embraced and extended" or anything else Microsoft has done? I wonder. Could they do anything, even?

Because outa is slang? And Arse is the correct spelling?
An ass is a beast of burden, not an anatomical feature.

Congratulations! That is, without a doubt, the best argument in this entire thread.

May the software companies be free to do what they do best. Develop and publish software. And the government free to do what it does best, tax the taxpayers.

Gee, I hope I don't get on the FBI's "watch" list for posting this!

Context, you can hardly have your head up a "beast of burden" ;)

David Ogg <davidogg@nc.rr.com> did eloquently scribble:
> What would the government do to Linux if Linux had "embraced and
> extended" or anything else Microsoft has done? I wonder. Could they do
> anything, even?

Linux COUDN'T embrace and extend... Embrace and extend involves not only adopting and corrupting an accepted standard... It means keeping the additions and changes to that standard secret. (Or refusing to allow it's use elsewhere). Kerberos is the perfect example.

They took the code from the FreeBSD codebase. As FreeBSD license allows anyone to do anything with the source code they want as long as there's an acknowledgement, they extended it and then, when someone found out what the extensions were and posted source code, M$ forced them to remove it from the web.

Every spelling flame has to have at least one mistake in them. It's the Law. (And what the hell is a "grammer"?)

Why no parallel ports at $300 your market is the poor and they are
going to buy the $5 printer from the Goodwill not the $150 USB
printer from Best Buy.

Graham wrote in message <6172ee17.0107230800.806c967@posting.google.com>...

Looking at what you all say it looks like you want to put an Imac mother
board in an mac LC with a cd instead of a floppy.

Windows 3 came out less then 15 years ago before that there was 0
software for it when an OS come out and it is used by a large base of people
software is written for it so it does not matter what OS you start with for
your new machine if you can sale a large number of them.
but you do need to get the cost down to $150

Windows 3 could run software written for Windows 2 and probably even
Windows 1, not to mention all the DOS apps available at the time.

Yes, but it wasn't the best software base available, which was *my*
point.

Chris

Actually it's because they don't own Amiga any more. If they had released an Amiga under the Gateway name, then what you ay is probably true. However, if they had released one under the Amiga name it wouldn't have mattered. Anyway, this is all ancient history now.

Chris

Perhaps I'm out of date, but I seem to recall Gateway creating a a subsidiary
wholly owned, that was to create and sell Amiga/DOS hard/software.

5$ for the printer and 30$ for the cardrige? :)
You can get decent usb inkjet printers for <80$.
If someone cant spent 40$ on a printer, and can only afford 5$, then they really
need to get creative to refill those cardriges.

They did, and you *are* out of date.

Gateway created Amiga International IIRC, which was wholly owned.
However, they screwed around with various half hearted plans, and
various chief execs, and finally sold everything except the technology
patents to a company called Aminos at the end of 1999. Aminos was
owned by a consortium of people, the two most prominent ones being
Bill McEwen and Fleecy Moss, both enthusiastic Amigans and former
Gateway employees. Aminos has since changed its name to Amiga Inc
(http://www.amiga.com) and they hold all licensing rights to Amiga
technology.

There's quite a lot going on in the Amiga scene at this time.

Yes, but you're out of date.  Check out http://www.amiga.com

Chris

> > What would the government do to Linux if Linux had "embraced and extended" or anything else Microsoft has done? I wonder. Could they do anything, even?
>
>
> Linux COUDN'T embrace and extend... Embrace and extend involves not only adopting and corrupting an accepted standard... It means keeping the additions and changes to that standard secret. (Or refusing to allow it's use elsewhere).

Ok, not a good example, I'll pick another one, what if Linux integrated a free web browser into it's interface? What if (hypothetically) this put someone out on the street. What could the government do? Should they do anything?

> Kerberos is the perfect example.
> They took the code from the FreeBSD codebase. As FreeBSD license allows anyone to do anything with the source code they want as long as there's an acknowledgement, they extended it and then, when someone found out what the extensions were and posted source code, M$ forced them to remove it from the web.

This is where that double edged sword could hurt Linux. If the government is empowered to bitchslap developers who change protocols to extend them, could not this empowerment also be used to bitchslap developers who reverse engineer protocols to be compatible?

I think the safest ground we could stand on would be that protocols be considered speech, and be given the same standing constitutionally. (Posting the source code is a different story.) Let Microsoft extend whatever they feel like, we'll be right behind them developing tools that integrate nicely with those changes. Both these practices should be protected, as attacking one hurts the other.

This way, any percieved improvements are realized by consumers, regardless what product they choose, and competition is still occuring, with the consumer benefitting from the race. That /is/ the only thing the government is supposed to be concerned with in a monopoly case anyway.

Consumers do not benefit in any way by having the government soft-enforcing a protocol tweeking taboo.

If you look closely at what's happening to GUI's right now, Microsoft /is/ competing, everyone is. Apple is making drastic changes in it's UI, Linux is also, and Microsoft is changing the GUI at a faster rate than they have ever done anything before. This race they're having is picking up speed and the consumer is benefitting on all fronts. And this is how it should be.

What we don't need right now is Big Brother stopping this race, so that Linux and Mac might slow down, and then we lose because competition has stopped again. Besides, it's getting interesting ;)

Oh dear.  Oh dear, oh dear, oh dear.

I would suggest digging up; or at least, don't dig anything further.

Free clue: Linux doesn't work like that, dear.

What I did to get a decent supply of cartridges for my HP 560C (paid
$7.00 for it at Goodwill) was buy up more printers at the thrift stores
averaging around $5 - $7 each (half that sometimes depending on what
color tag is on sale), pull out the cartridges, then redonate the
printers. One of them even had a couple extra sealed cartridges (2
black and one color.) So I'm set for a while.

I always thought most implementations of Linux included Netscape
Communicator anyway.  And Opera would be a good alternative (rapidly
becoming my primary browser under WinBlows-98).

Not true, We sell other OS's, give us a call for a quote, and I'll prove it.
Microsoft doesn't impose those restrictions on us.

David Ogg (919)468-6365 (919)468-6366 fax (919)468-6367
Registered Microsoft OEM Partner

Gateway had other motivations for wanting Amiga.

Compaq puts out other OS's, ones that compete squarely with NT/2000!
Dell, IBM offer Linux.
Not to mention SGI offers unix.

Not sure where this rumor started, but I've heard it before.

Some do, some don't.  (Debian, for instance, can't under its license.)
You also often get lynx, links, KDE's browser (Kylix?  I forget) and so
on.

This is very different from integrating it into its interface, or some
other such nonsense which assumes all OSes work like Windows.

Nothing. Linux is not the product of a company that has a monopoly. So none of
these questions apply.

> Should they do
> anything?

But they aren't so empowered.
It's really very simple. The rules you have to play under change once you achieve
monopoly status. You may not use your monopoly to maintain or extend your
monopoly. So Micro$tuff is a very special case that doesn't apply to hardly any
other high tech company (possible exceptions: Intel and IBM [IBM once came close
to a breakup because of it's abuse of monopoly power, they backed down and played
nice, something Micro$tuff doesn't seem to understand how to do])

Roy

> that integrate nicely with those changes.

Here's how it has worked with their "extensions", they made changes to Win 95 and Win 98 at the request of the Office programmers. Not too much wrong there. They made such changes available to the WordPerfect and Lotus Suite programmers, once those programmers learned of the existence of the changes, and then asked for the information.

Do you see the difference? In house products teams had weeks, if not months lead time so their products were out first, and had a much closer working relationship with the Systems programmers than ANY competitor could possibly have. That allowed the Office products to maintain and extend their lead over their major competitors. American law prohibits that as unfair when done by a monopolist.

The kicker is that Micro$tuff is STILL denying that they have a monopoly. I suppose they would only acknowledge it when/if they achieve their wet dream of all computers everywhere using M$ OS.

On yeah, and how much has their market share gone up?

>
> Linux is also,

Big market share their too. Esp in Best Buy, Sears, and Walmart computer depts.

> and Microsoft is changing the GUI at a faster rate than
> they have ever done anything before. This race they're having is picking
> up speed and the consumer is benefitting on all fronts. And this is how
> it should be.

Ah, but what happened to DRI?
How often do you see the Lotus Office Suite (assuming IBM didn't finally throw in the towel) bundled with a computer? Or the WordPerfect suite? How much shelf space do they get at the Best Buy, Office Max, Office Depot, Circuit City, compared to M$??

>
>
> What we don't need right now is Big Brother stopping this race, so that
> Linux and Mac might slow down,

You won't. Big Brother might slow down M$, but not competitors with less than 10% of the market place. In a case like this, Big Brother's job is to make sure that the race is fair to the little guys.

Roy

(sigh!) you're missing the point. Make something up yourself. We're not talking about what linux is, we're talking about what the government should be/shouldn't be able to do.

Anyway, linux isn't like /anything/, "linux" is just a kernel, I can make the "linux OS" anything I feel like dear. kernel 2.4 has a built in *web-server*, by the way, by "built in" I mean right in the kernel.

Not even Microsoft has a webserver in the kernel, so, how does "linux work" again? ;)

>(sigh!) you're missing the point.

Nope.

> Make something up yourself. We're not

>talking about what linux is, we're talking about what the government
>should be/shouldn't be able to do.

And you're making some spurious links to Linux, not understanding the first thing about what you're talking about.

Remember: Just because MS do their Operating Systems one way doesn't mean all Operating Systems work that way. Hence, what the Government do there doesn't apply to some other OSes - because it's entirely irrelevant to them.

```
Government: "Microsoft, no integration of browser with OS!"
MS:         "Squeak!  Yes sir!"  (eventually, maybe)
Government: "Linux, no integration of browser with OS!"
Linux:      "Erm, we don't."
```

You're trying to make links between two entirely incompatible situations. What a Government can/can't do with Microsoft is entirely different to what it can/can't do with Linux - because the entire system doesn't work like that.

Free clue: When giving examples and analogies, try harder to make them relevant.

```

The question was hypothetical, the situation posed in a hypothetical
question need not be fact. The question I asked was "what if", and it's
an interesting question, what if Netscape decided to become available
free with every linux disrobution and became the almost exclusive
browser? what could the government do?

If that was the case, then "embrace and extend" would be moot anyway.

> monopoly. So Micro$tuff is a very special case that doesn't apply to hardly any
> other high tech company (possible exceptions: Intel and IBM [IBM once came close
> to a breakup because of it's abuse of monopoly power, they backed down and
played
> nice, something Micro$tuff doesn't seem to understand how to do])

A monopoly means more than "most people use Microsoft." Microsoft does
not have a monopoly. Even, of all people, RMS has stated that everyone
has a choice of what OS to use. A corporation is not a monopoly because
the free will of the people chose one product over another.

Case in point: IBM, you /could not/ built an IBM PC without an IBM PC
BIOS, therefore IBM had complete /exclusive/ controll of the market,
regardless of the purchasing decisions of the consumer. This is what a
monopoly is.

 (By the way, we broke that monopoly by reverse engineering the BIOS,
see? Kind of like the kerberos example. The court should do the same
thing they did then, allow an implementation of that functionality to
be duplicated.)

 Microsoft, on the other hand, was voted to where they are now by the purchasing decisions of the free willed people. There are alternatives, for crying out loud Microsoft has one of the hardest competitors in the world to compete with, a competitor who /gives it away/ (sound familliar) and has both the popular and (arguably) technological advantage over them. Not just in the OS market, but (especially) the server, and (mostly) the webserver market. Microsoft's momentum is /hardly/ increasing, and more and more options are developing every day.

> Here's how it has worked with their "extensions", they made changes to Win 95
and
> Win 98 at the request of the Office programmers. Not too much wrong there. They
> made such changes available to the WordPerfect and Lotus Suite programmers, once
> those programmers learned of the existence of the changes, and then asked for
the
> information.

A lot of competing companies had inside knowledge of Windows, look at Adobe. Adobe knows more about the inner workings of the Windows Print architecture than Microsoft. You know why? Adobe /designed/ it! The public was highly skeptical about the quality of it before release, so Microsoft called Adobe in and had them completely overhaul the entire print archetecture. (there's actually a neat story behind this too)

How about the inner workings of Microsoft Networking and the NetBEUI protocol? Did you know that it was ProComm who put that there? NetBEUI, Microsoft's "plug-and-play" networking protocol, was purchased from them.

Adobe has been successful in Windows printing, Procomm in networking. Microsoft doesn't even have the edge on alot of the code they themselves distribute.

> Do you see the difference? In house products teams had weeks, if not months lead
> time so their products were out first, and had a much closer working
relationship
> with the Systems programmers than ANY competitor could possibly have. That
> allowed the Office products to maintain and extend their lead over their major
> competitors. American law prohibits that as unfair when done by a monopolist.

But the fact that others were developing and releasing competing products, and making money doing it, precludes Microsoft from being a monopoly at that point in time. If you remember, Lotus was very successful. In the end we mostly moved to MS Office because we liked the product better, if we didn't we, to this day, still have the choice of using other products. StarOffice comes to mind as an excellent alternative (I can't stand the interface though)

> The kicker is that Micro$tuff is STILL denying that they have a monopoly. I
> suppose they would only acknowledge it when/if they achieve their wet dream of
> all computers everywhere using M$ OS.

I deny it too. I have plenty of options. I'll deny it untill there arn't
any options. Then it will be a /monopoly/. A monopoly means NO options.
Like Bell telephone, IBM making the only machines with an IBM BIOS.
OPEC. Let's face it, it was Darwinism that built Microsoft, it's
Darwinism that will bring it down, and it can and /is/ happening.

> > Both these practices should
> > be protected, as attacking one hurts the other.

> > If you look closely at what's happening to GUI's right now, Microsoft
> > /is/ competing, everyone is. Apple is making drastic changes in it's UI,
>
> On yeah, and how much has their market share gone up?

 Not relevant. It certainly can't be because of Microsoft Office,
because Office on the Mac is better and more stable than Office on the
PC (from what I've heard). This is (from "what I hear") typical, I hear
Photoshop and alot of other apps that exist on both Windows and Mac are
better on the Mac. This tends to put a few holes in the theory that
Microsoft giving inside Windows OS info to Office developers made
windows more popular, because that Windows OS Office is supposedly
inferior to the MacOS Office, regarless of "inside knowledge"
 And the kicker is, You can have all the inside knowledge of the MacOS
you want now, at least the "Darwin OS" parts because it's OpenSource. So
according to the inside knowledge leads to market monopolization theory
posed, the Mac should be cleaning up, right? So how much /has/ there
market share gone up?

> > Linux is also,
>
> Big market share their too. Esp in Best Buy, Sears, and Walmart computer depts.
>
> > and Microsoft is changing the GUI at a faster rate than

> > it should be.
>
> Ah, but what happened to DRI?
> How often do you see the Lotus Office Suite (assuming IBM didn't finally throw
in

> the towel) bundled with a computer? Or the WordPerfect suite? How much shelf space do they get at the Best Buy, Office Max, Office Depot, Circuit City, compared to M$??

About the same amount as the customers ask for them. Shelf space does not a monopoly make, When I decide what to stock, it's based on demand, and customer demand is the free will of the people, nothing more.

> > What we don't need right now is Big Brother stopping this race, so that Linux and Mac might slow down,
>
> You won't. Big Brother might slow down M$, but not competitors with less than 10% of the market place. In a case like this, Big Brother's job is to make sure that the race is fair to the little guys.

And what have the "little guys" been doing? Generally nothing untill Microsoft develops something they need to compete with. There's been a lot of companies resting on their laurels untill they /have/ to improve something because Microsoft is killing them. Don't believe me? let's take a closer look...

PalmOS, who swore up and down consumers don't need color. fine everyone settles for b&w, and Palm own3Z the market. WinCE comes along, and Palm responds with the new color models, but by now they're already losing market share daily, and the palm VII I *just bought* is now on fire sale as best buy for half the price I paid a few months ago for it.

Novell, once prime master of the universe in networking, decided it didn't want to make a VXD implementation of Novell client for Microsoft right away, they decided their legacy .386-file architecture was all anyone needed. Microsoft, who at first didn't even install networking protocols in win95 by default, and even included a limited novell client, responded to the delay imposed by novell by incorporating NetBEUI (mentioned above) as a stop-gap measure untill novell woke up to consumer demand. Too late. novell is now largely irrelevant.

OS/2, an Operating system more object oriented than Windows is /to this day/ practically abandoned by it's creators even though people are practically begging them not to discontinue it. It's still a staple in most banks and runs a majority of the ATM machines out there. IBM has publically stated they don't plan on supporting this OS.

BEOS, a very capable OS, but one that it's creators have no interest in persueing, deciding they want the embedded market, despite a loyal following of users and tinkerers. Heck, by the time I even discovered BEOS, they had already abandoned it!

On the other hand, there are very good developers out there that make a killing competing against Microsoft because they are /good at it/ and the consumer /prefers to use them./ Adobe is a prime example here, as are Macromedia, Citrix, Borland, Sun, AOL, Symantec, Peachtree, Intuit, and many others. They have prospered because we vote for them with our patronage when we choose them over Microsoft. They have responded to the demands placed upon them by the consumer, faster or better than Microsoft has, and thus prospered. This is how it oughta be.

Some people may feel sympathetic to Netscape, but the fact was they were charging money for a product that could have taken on microsoft and won, but they decided they preferred to be Adware instead. they could have improved their product, but they decided to open a portal during the portal craze and rest on the portal, and their laurels. If Microsoft didn't do it, someone else would have.

that's the thing in a free market, you live with the fear that someone will be faster, better or cheaper than you are. You adapt, or you win the Darwin award.

Anyway, back to your original comment, the government's job is *NOT* to make the race fair to the little guys. the goverments job is to make the race fair and beneficial to the *consumer*, even if it means the "little guy" goes out of business. the government has the power to grant monopolies for this purpose so long as it benefit's the consumer.

But again, Microsoft is where they are because we put them there, and it's in our best interest to let them compete.

```

> Free clue: When giving examples and analogies, try harder to make them relevant.

Actually, now that we somehow got our shirt stuck on this nail that wasn't relevant to the subject at hand anyway, just kind of provided like a freehand sketch for those that lose interest in the text without pictures version...

Linux is not an Operating System. It's not up to "Linux" what gets integrated into the OS. Redhat, Slackware, ect are Operating Systems, They decide what gets integrated into the OS. Linus is just a kernel.

The Analogy was NOT between "Windows and Linux", The analogy was between two "Equally /available/" operating systems. the consumer has the same access to one as the other, illustrating something not true in a monopoly.

As for (re: linux) "They don't do that", who are "They?" and what dictates what "they" do? Is not Linux open for anyone to do what they please? In my "Linux on an Amiga in a Box" half-hearted kill-time project I work on ocassionally, should I contact "them" to find out what I can and cant do because "we dont do that?"

Unless Linus has contacted the hundreds of copyright holders on the various pieces of code, and they all decided to stop distributing the source under the GPL, I'm pretty sure I can integrate anything I damn well please into the kernel, or my OS. Of course it will be tricky, as I'm using the uClinux kernel so as to make it work on older Amiga's without an MMU/and UAE, and I can't get the file system to work, even though everything "should work" (I'm abandoning it soon I believe, I've decided it's time for a new project, a gnutella client that doesn't suck)

Back to the point, the question (again) isnt like you said, "What they can/can't do", I asked what they "Should/shouldn't be allowed to do", this isn't a question of opportunity or current legal precidence, but a hypothetical question of ethics and what level of government inervention is beneficial to the consumer, and why.

The answer to that question is they should either A) side with the
small businesses being hurt by Microsoft, or B) side with the consumer,
who chooses to use the Microsoft product over the competitor.

I wasn't expecting C) "Linux doesn't work like that", and I apologise
for my foggy analogy. The illustration was an afterthought ;)

David Ogg <davidogg@nc.rr.com> did eloquently scribble:
> Ok, not a good example, I'll pick another one, what if Linux integrated a free web browser into it's interface? What if (hypothetically) this put someone out on the street. What could the government do? Should they do anything?

Linux doesn't need to "incorporate it into its interface" in the way you mean... There are several free web browsers included with every linux distro. And yes, depending on which windowmanager/desktop environment you choose, there are integrated ones. But not of them are forced on the user.

And as the source code is free... It would be easily UNintegratable if someone DID want to reassert their choices.

>> Kerberos is the perfect example.
>> They took the code from the FreeBSD codebase. As FreeBSD license allows anyone to do anything with the source code they want as long as there's an acknowledgement, they extended it and then, when someone found out what the extensions were and posted source code, M$ forced them to remove it from the web.

> This is where that double edged sword could hurt Linux. If the government is empowered to bitchslap developers who change protocols to extend them, could not this empowerment also be used to bitchslap developers who reverse engineer protocols to be compatible?

Think of it this way. Someone working on FreeBSD wrote that kerberos protocol. OK, he released it under the FreeBSD license, but when M$ extended it, did he get anything for it? Did he even get to see the changes?

That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code legally without releasing any changes they make back into the community.

> I think the safest ground we could stand on would be that protocols be considered speech, and be given the same standing constitutionally. (Posting the source code is a different story.) Let Microsoft extend whatever they feel like, we'll be right behind them developing tools that integrate nicely with those changes. Both these practices should be protected, as attacking one hurts the other.

fine... let them keep the source, but they DON'T publicise the actual protocols... Hell, even their own protocols (word document format anyone?) aren't fully compatible with each other in an attempt to force people to needlessly upgrade their software.

Why not build it with a buildt in monitor like these TV s with buildt in
VCRs kinda like a old Mac Plus

I mean verbatim what I said. Name your specs and I'll find you a PC.
you want QNX? NetBSD, FreeBSD, OpenBSD, NT, Windows (MS), Solaris,
SCO Unix or Unixware?

If the OS is available, it's available on a new PC.

<disclaimer> (and this isn't a cop-out)
This does not include asking for hardware and OS combinations where the
OS doesn't support the hardware you asked for, then claiming I lose
because said hardware won't work, ie: asking for AmigaOS for the Vic-20.
</disclaimer>

<good faith>
I won't just say it's available, I will point you to where you really
can purchase the machine, and actually get a quote for the machine, with
your OS of choice installed, at a very competative price. If you need me
to show you the actual quote to prove it, then so be it.
</good faith>

> AOHell (in addition to listing the hardware of course). At those mass-market chains, you never see systems with stats placards boasting Linux and Star-Office. And the sales rep most likely won't even consider mentioning those as a possibility (if he even knows what Linux is).
>
> As an example, only about 2 years ago, I was at the Base Exchange at McChord AFB, and was looking over the different computers in their electronics department. I asked the sales rep there if I would be able to buy one of their systems without any OS installed, since I was scouting out a system to become a Linux box). He just flat out refused. I don't remember the reason he gave, but if I wanted one of their computers for my Linux system, I would have to get it with Windows-98 preinstalled, which I wouldn't have been using anyway, so why would I want to pay extra for it?), reformat, and then do my Linux install.
>
> So, to cut this post short, since I nearly lost my train of thought here... What good is having choices in operating systems and other software packages, if the typical consumer doesn't know about those choices and the folks selling the systems won't volunteer that information?

Not much good at all, I agree.

This is why Microsoft has been so successful, people don't know any better, some people. It has very little to do with availability, or any other notion that "you can't get it" (the competitors product.)

That however, would be ridiculous to try to pin on Microsoft. (although in our courts, anything's possible ;) I can see the headlines now: "Microsoft charged with having customers who don't know any better, Microsoft denies charges, plans to appeal."

The truth is, the customer has choice. If he can't make an informed choice, then maybe we should make more effort to inform people of the choice they do have.

You could get "98lite" which is a piece of software that lets you do a number of things...

1) Install 98 without IE.
2) uninstall IE from a preinstalled 98
3) install 98, and IE, without integrating them.
4) deintegrating IE from a preinstalled 98

You don't need to use this product though, as you can do it yourself if you feel comfortable juggling system files. I might try to dig up the instructions for the DIY method, if I get a chance.

What on earth gave you the idea routing was hard in Linux? IME, it's a damned sight easier than in anything from MS. It's even easier in OpenBSD and Solaris.

>   wierd protocols like PPPoE)

I see no point in PPPoE. Why would I ever want to use it? I'm not even sure what uses it other than some broken cable modems used by inferior providers of no service worthy of my consideration.

I guess I'm a total novice about DSL.  I have cable, and my Linksys
Router/Switch came with directions about setting up PPPoE, but seemed to
imply that it's necessary for DSL.  I certainly don't need it with cable.

Maybe that sheds some light on this sub-sub-sub-topic?

Actually in my area, it's DSL that uses PPPoE...Qwest does it with
some internal DSL modems from Intel so they can turn off the
connection when the person isn't surfing the 'net.

Of course, you can get the DSL without having to use that, but it's
an extra $10 a month plus you have to pay for the modem...they give
you the Intel internal modem for free...

..."are things usually done by someone who should probably spend a
little time learning anyway."

PPPoE is used mostly by DSL providers.
```

It's a pain in the butt to do in linux, when you have multiple distinct
PPPoE clients that must be routed securely, not just "NATting" them
together behind one PPPoE interface to the DSL.

As far as there being no point in it, if you get stuck having to do it,
you have to do it. (and it sucks)

Read your own posts. Your lies & misshapen delusions speak for themselves. Now crawl back under your rock and leave the real world alone since you obviously have no place in it.

Notice the vidiots use of the german language in a vain attempt to cover its own
stupidity hoping nobody here is fluent in german.  It just proved itself gormless
in 2
languages.  Little does it know many atari developers are German and can easily
spot its
diatribe as no more than its usual bollox.

Gregory,

That conspiricy theory sounds like sinclaps usual tactics in his self appointed job as unofficial MacVidiot. Notice how the vidiot stated tech tv dissed atari yet also states they never mentioned atari. One cannot insult atari by saying nothing.

This is not the least bit factual. Intel processors are notoriously
ineffecient.   all attempts at having them emulate other processors, even
older ones, has been a miserable failure.

What utter rubbish. Realspec on my old intel emulates a Sinclair Spectrum
very nicely indeed.

D.

You've never played Atari ST games on a PC using an emulator then, I
take it?   Or Atari 8-bit computer software on a PC?

Hey Dunny

Don't waste our time. You have not proof. I've been programming and working in electronics for years not only as a hobby but also in my career. I am quite familiar with the intel, 6502 and other processors. You simply cannot effieciently emulate one cisc process on another. Its physically impossible.

Bob,

I've made the rounds of nearly all the emulators. No fallacious arguments to say software emulation is easy or stable can hold up to scrutiny. take a close look at what you need to emulate a stock 8mhz ST on any PC, it isnt the least bit realistic on anything less than a Pemtium2-200 and certainly isn't stable. Risc processors have a better time with emulation but don't even try to waste more of my time saying any intel processor can do a good job of it. It simply isn't bact up by any fact, and likely never will be.

Bob Retelle wrote:

Utter nonsense.

The architecture of the Z80 (used in the Spectrum Dunny referred to) and
x86 have a common ancestor (the 8080) which means you can produce some
very effecient emulation because many things, like flags etc, are very
similar.

So how is it that by sitting in front of a pentium 150 I can run JPP or

Realspec (slowly) and play a nice game of cybernoid? Hmm? You sir, are talking out of your bottom.

For more proof, visit www.worldofspectrum.org and see what a KNOW LIAR you are.

D.

Even Apple had a license to bundle Win'95 at one point (PC Compatibility
cards).

Trivially false, because it has been done.

read any copyrights messages, they ussually all suck and you have to travel all
over the world if you want to sue them, for all contain"according too (name a country) law
and ...... will be held by .... courts." So you better like traveling. :o)

Why should they have to though?  What extra power would my parents get (word
processing, internet, dtp, spreadsheet)  by using Linux over Windows or her
Mac (actually my old Mac)?  What advantages would I have in using Linux over
Windows as an application programmer using VB, C++ Builder, VC++, Jbuilder,
SQL Server etc?

> --
> Security-wise, NT is a server with a "Kick me" sign taped to it.

And there are not dozens of known security holes in most Unix/Linux
distributions?  Every scanf(),gets(), sprintf(),strcpy in the OS is a
potential security hazard.

How about, YOU don't waste any more of OUR time telling us we don't do
what we obviously CAN do with emulators?

How odd. This 'ere DSL works with Proper Protocols over Ethernet.

>Maybe that sheds some light on this sub-sub-sub-topic?

None whatsoever :-)

Recent kernels can be compiled with their version of GCC. When RedHat 7.0 came out this problem did exist indeed, but it has been resolved by now.

Gcc 2.9.6 was the most stupid thing they have done in years anyway. But apart from that I find RedHat quite usable, although not perfect. But who is?

> AOHell (in addition to listing the hardware of course). At those mass-market chains, you never see systems with stats placards boasting Linux and Star-Office. And the sales rep most likely won't even consider mentioning those as a possibility (if he even knows what Linux is).
>
> As an example, only about 2 years ago, I was at the Base Exchange at McChord AFB, and was looking over the different computers in their electronics department. I asked the sales rep there if I would be able to buy one of their systems without any OS installed, since I was scouting out a system to become a Linux box). He just flat out refused. I don't remember the reason he gave, but if I wanted one of their computers for my Linux system, I would have to get it with Windows-98 preinstalled, which I wouldn't have been using anyway, so why would I want to pay extra for it?), reformat, and then do my Linux install.
>
> So, to cut this post short, since I nearly lost my train of thought here... What good is having choices in operating systems and other software packages, if the typical consumer doesn't know about those choices and the folks selling the systems won't volunteer that information?

Ok. look in your crystal ball... how many people will get a linux PC when they walk in Fred Meyer over a Windows PC?
They get the PC, then ask to look at the software section, or maybe ask if they can run the same software they saw at their friend house.

I'm sure it better today and you dont have to spend a week getting a dev environment
to get basic tool to work. But its still a far cry from the software you get under windows.

Like you hint, the guy probably dont know linux.... can you imagine the guy walking back
asking for basic question as to why his new directx game wont install, or how does he
setup the new usb scanner he just got... or import his digital camera images, etc.. etc.. etc..

We are talking about 0.000001% . Thats why Dell droped the ball on linux. They dont offer
this as an option anymore. They realized that linux market is super specialized server and hacker.
And hackers build their own PC's :)

BTW, I beleive its possible to have API like directx working on linux... So 'pure' directx dev
could be ported in a snap to linux, but who we spend that level or R&D for those linux user?

I think they took it like "Remove your network stack, bad bad boy! you are a monopoly
you can integrate a network stack!" and from a totaly stupid request they just said "no cant do"
because giving a valid answer wouldn't have made a diference.
In my view MS is really down at many people like they are technologie moron.

Anyway, lets look in 5 year as to what OS WONT have an integrated HTML 'parser' in the OS
as a base API service.
Should the US gov (and tax payer) bring to court QNX, Beos, etc.. ?

BTW, what happen when you type a ftp or http address in an explorer windows?
If you install Netscape can you 'fix' the now broken desktop and allow for those space to be browsed again?
Who make 'namespace' http support for windows?

Anyway... time will again prove MS right and linux will follow.

> Mac (actually my old Mac)?

None if they can use Office/Works already. I would give the Unix Office applications a year to become functionally more useful than the MSOffice equivalents. By more useful I don't mean that they will do everything that the equivalent MS program would do, but it would do it correctly. Office has so many bugs it is unbelievable. Still, large software programs have bugs, so the Unix Office apps will get them as well. I just hope that the emphasis for the Unix Office apps is going to be stability and bug fixing over feature bloat.

The Windows interface is just as confusing to newbies as the Linux one (say, KDE). Except that KDE comes with a whole pile of apps preinstalled for free, KOffice, Konqueror, silly games, etc. Linux is just a mess under the surface though, and the surface is dodgy. For a home user desktop, it needs a single, consistent interface, easy to configure printers, hardware, etc. MS is way ahead in these areas. QNX is the best alternative desktop OS I have seen to date.

> What advantages would I have in using Linux over

> SQL Server etc?

VB - MS Technology
C++ Builder - Borland
VC++ - MS
JBuilder - Borland
SQLServer - MS

You would get none, of course. What advantages would I have in Windows over Linux as a server programmer using Perl, PHP, Python, PostgresQL/Oracle/MySQL?

> And there are not dozens of known security holes in most Unix/Linux

Hence you should use the more secure alternatives with length parameters to prevent buffer overflows, such as strncpy.

And in particular, scanf(), gets(), sprintf(), strcpy() are not OS
functions but C runtime library functions, and the security holes

within these functions are present in *all* C runtime libraries,
including those running under MS-Windoze....

scanf() in particular is useless for anything but quick'n'dirty
throw-away test programs, and should never be used in a real
application.

Hi

Do "Fast Forward" have a website? Any details appreciated!

I'm not the originator of this message, and no, I don't have such a list.
But there is one very annoying aspect to MS Works.  To my knowledge, there
are no other word processors or spreadsheets that can import files saved in
the proprietary MS Works formats.  True, you can export from MS Works if you
know in advance which other program you will be using to work on Works
files, and that program is on the list of "save" formats in MS Works.  But
it's darned inconvenient for people who start out with Works and then want
to use something a little more elaborate.

But now we are WAY off topic!

i was in a comp u.s.a. today to pick up some mac stuff for my sons g4, and i gotta tell you it was bleak, there was nothing that he wanted, we were told it all had to be special ordered. the software selection is almost non-existent.
it reminds me of the atari situation in 1992.
i think that the new amiga clones, and tos clones might help save apples day. this is something that i repeated before. at least it will help apple in the production end because any addition to volume will help them out, plus there might be cross platform written software.
there is a mighty loyal following still on the tos, and amiga market, though small still anything will help all 3 survive.

> use and for hobbyists. How would such a system look?

I would go for something very simple: a very compact hand held or palm

pilot type machine with a 6502 or 65816 CPU, either 4 or 8 megs of
RAM, 320x200 / 640x400 LED display, a GEOS or Palm OS type operation
system: it would include both a kernal layer and a GUI layer so that
the GUI can be shut down by a program. It would be a machine that
could be used for something like a Gameboy
or a Palm Pilot but would include lot of IO ports for external extras
like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM,
printer ect. and can be used as a simple home computer or web browser
as well as a control module for other hobby projects.

I would also include a built in assembler and another simple high
level languge like BasicX (which will allow inline asm like Turbo
Pascal does).

Oh, yeah... if possible I would also include network support so that
these hand held computers can be chained together. Maybe infrared IO
too.

> pilot type machine with a 6502 or 65816 CPU,

Or for $10 more, you could have a 200MHz StrongARM processor or similar in the device, along with easy, cheap support for the interfaces you list below.

I like ARM processors, and really want a fast XScale based laptop or computer. Not much chance of getting one soon though.

> either 4 or 8 megs of RAM,

For a handheld device, low power memory is essential. Hitachi just this week released an 8MB memory chip that uses 30% less power and is even faster. Given the cost of memory, it makes sense to hit the sweet spot in price rather than the cheap spot, and I imagine that could be 16MB or 32MB. Which is a lot for a handheld device unless you run WinCE. Which I wouldn't want at all. So lets spoil ourselves anyway.

> 320x200 / 640x400 LED display,

If you have a keyboard on the device (like a Psion palmtop) then a 640x240 half-height display (Psion 5) or 640x480 display (Psion 7) would be great.

Without a keyboard you would have a conventional palmtop display of 320x240.

> a GEOS or Palm OS type operation
> system: it would include both a kernal layer and a GUI layer so that
> the GUI can be shut down by a program. It would be a machine that
> could be used for something like a Gameboy

Palm do have a very good frontend for launching software on a palmtop device. The software choice is very good as well. The underlying OS is a bit didgy though, but they are moving to ARM, so hopefully they will sort these things out and get a solid OS in there under their GUI stuff.

> or a Palm Pilot but would include lot of IO ports for external extras
> like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM,
> printer ect. and can be used as a simple home computer or web browser
> as well as a control module for other hobby projects.

Yikes, where to put the ports on the device! I suppose it could have one of those laptop bay-extender thingies, which could have a DVD/CD drive, HD, etc in it.

Wireless ethernet would be a very useful feature.

Mouse wouldn't be necessary with a touch-screen system. A small portable printer for the device would be neat though - an A5 printer :) Still "neat" is not "needed"! Audio recording and playing is necessary, as is decent video, which palmtops really need. How about some 80's style graphics hardware trickery! Sprites, hardware scrolling, block mode graphics, etc, but with a 16-bit screen :) - then again, the GameBoy Advance has that and more now... maybe some lowend 3D hardware instead!

> I would also include a built in assembler and another simple high
> level languge like BasicX (which will allow inline asm like Turbo
> Pascal does).

That would be fun.

Graham

Which CompUSA? Did you try Micro Center in ST Louis Park via HGWY 100
North off 36 West/Excelsior? Also, the Apple Store is opening at the
Mall of America on Saturday which is suppose to carry from 300-600
titles. Todays Star Tribune has a piece with picture of new store in
the Business section.

Any news on the new Amigas such as release date? That will be
nostalgic from 1985...the good ol days..when AmigaWorld and Info
Magazine were anticipated. Also, the Atari rags were pretty good as
well with lots of focus on the small developers.

You all were saying that Atari is best for midi and still market leader
with humungous sales of atari clones in that market did you all not
say?  If so...would it not be prudent to include the market leader in
that tech tv segment?

sinclap!

Hi all,

As though following this discussion at a computer newsgroup I would like to follow the idea of some others:

What might be the purpose of this $300 machine?
What kind of task does it need to be prepared for?
By what features might it be sold? (What is the difference to existing systems ranging from gaming consoles to standard PC?)

While scanning through all the answers I picked out one topic pointed out several times:
it has to be userfriendly - that thing must be some sort of plug-it-in-and-there-you-go...

I consider that it should be some kind of entertainement-station looking like the typical audio-hifi-stuff. There has to be the possibility to run all kind of media: from CD, DVD, to internet-based-information (including connectivity for VCR, TV, ...).

Concerning the OS I am not sure if something capable of what I am thinking already exist: the GUI must be designed the way that even the unexperienced generation of my parents (~ 60 years) will be able to use it from the beginning: Putting in some media must make the thing behave like the very same machine they are used to. A DVD-movie must change the display to some kind of "VCR"-display with touchscreen-buttons and moveable-regs ...
Or feeding it with a electronic lexicon must change the display ... to some e-book like view, where it is straightforward to turn around "pages" or flipping over to the relevant part of the book.

Saying it short: fit it to the typical living room equipment, close to the TV. Prepare for all kinds of computer periphals and home equipment (coffee-maker, fridge ...). Integrate phone, fax, mail, sms.

To be discussed,
Helge

The address space of the 286 was 24 bit, although those 16 MB of memory was addressable only in protected mode -- in real mode, the 286 could address 1 MB + 64 KB.

helgetu (h.schaefer@tu-bs.de) wrote:
: What might be the purpose of this $300 machine?

It was originally targeted for computer hobbiests. Given the groups we are posting to, it would share some of the characteristics of the 8 and 16 bit machines of the 80's, or would suit the tastes of the current users of these machines.

I was thinking of something easy enough for an amateur to understand the electronics, and low level programmaming of the device. (My view is that modern machines are too complex and too poorly documented to fit this market.)

: By what features might it be sold? (What is the difference to existing systems
: ranging from gaming consoles to standard PC?)

Any computer would have to be differentiated from current PCs, game consoles, and PDAs in a *significant* way. It would be next to impossible to compete in the present computer/entertaiment industry with a product which the big guys view as viable.

: it has to be userfriendly - that thing must be some sort of
: plug-it-in-and-there-you-go...

User friendly is a very vague notion, because what is obvious for one user, will appear to be counter intuitive to another. Particularly so if you are attempting to differentiate yourself from current products. Also, there are different levels of user friendliness: easy to learn, vs. easy to use; also, I view current systems as being difficult to program (too much so if you are not a professional programmer). Older systems were much better in this respect. As an example: it was easier to put graphics on the screen in the olden days. With the Apple II you simply switched to the appropriate video mode, then drew lines or pixels. There was no windowing system, or complex event manager, to mess with. On modern systems, you need to obtain special tools (such as ghostscript) to create programs incorporating graphics -- in any reasonable manner.

: Concerning the OS I am not sure if something capable of what I am thinking
: already exist: the GUI must be designed the way that even the unexperienced
: generation of my parents (~ 60 years) will be able to use it from the
: beginning:

A nobel idea. It is not the suggested market, but you certainly have ideas worth exploring.

: Saying it short: fit it to the typical living room equipment, close to the TV.
: Prepare for all kinds of computer periphals and home equipment (coffee-maker,
: fridge ...). Integrate phone, fax, mail, sms.

Integrating too much stuff in one device can complicate the life of users. So, while a fax/mail/phone device may simplify communications, and a DVD/CD device may simplify entertainment (particularly given the physical similarity of the media), a DVD/CD/fax/mail/phone device is going to present too many dissimilar options to the user. IMHO, that is one of the reasons modern computers are not very easy to use. Better to use the old stuff, where the computers did computerish things (interactive entertainment, or content creation).

Byron.

I demand that Bob Retelle may or may not have written...

[snip]
> Having lived through the "OS in ROM" with the Atari ST, it can be a "double
> edged sword".   It WAS great to have the OS boot almost as fast as you
> could blink.

That's easily enough done on this Risc PC, should I need to do so. However, it's better to let it run its boot sequence so that disk-based resources can be located and initialised.

> Unfortunately though, if there were any bugs in the code, (HA.. IF) you
> were stuck with them until the manufacturer could get around to first
> finding them, then fixing them, then finally producing a new version, then
> distributing them, then finally you get to open your machine and manually
> replace them.

Or you might be able to load patches or replacement modules or even a whole ROM image. Two of those apply to this machine, and yes, there was a short while before I got hold of RISC OS 4 ROMs when I was softloading a version of the OS...

[snip]
> (Of course, it DID generate a nice little "cottage industry" for
> programmers to come up with fixes and patches while waiting for the

> "official" ROMS to finally appear.)

That happens in the RISC OS market to a small extent. Of course, it helps when the OS supplier can and does release patch archives (or "service packs").

> Do you really want "Mom and Pop" $300 computer buyers to have to be prying
> ROMs out of sockets and jamming new ones in?

Probably not... flash ROM is finding its way into new machines and onto some hardware upgrades; there is a StrongARM processor card which has this.

> Actually what I always thought Atari should have done with the ST was to
> put the OS on a cartridge.

Maybe...

> That way they could issue updates which could be swapped as easily as
> changing a game, and the old cartridges could be returned in the same
> shipping box for a credit. Sort of like deposit soda bottles.

Or you could keep it and sell it on to somebody who hasn't upgraded to *that* version, never mind the current one. Although that's almost as easy with just the chips themselves :-)

[snip]
> FLASH RAM would be workable, but...

Flash ROM, surely.

> you'd also need a boot ROM with the read/write routines for the FLASH
> update in it.

True...

> Otherwise, one hiccup and your computer's OS could be toast with no way to
> fix it. Just like blowing away a motherboard with the wrong BIOS upgrade.
> And of course, add the cost of the boot ROM and interfacing.

Not to mention if you have your mass storage on a third-party interface card which has its own on-board firmware, which the OS will softload or access directly and which is probably itself in flash ROM... although in this case, a floppy with the firmware and, optionally, a flash programmer for that card would do.

How about Transmeta's Crusoe? This would outsell everything mentioned thus far I guarantee it. It can emulate anything, including x86 at native speed!

Can you imagine UAE ported to Crusoe as its code-morphing layer? incredible.

Modules could be made for just about ANY old school CPU/platform, and an OS wouldn't need to be developed for it, as it could run these platforms OS's natively, maybe even in addition to a custom OS.

Marketing would be a piece of cake, as you could use it from anything from a Kiosk to a webserver, an Amiga emulator to a Unix portable. Webpad's, PDA replacements, hardware controllers, you name it, this thing would be /versatile/!

And the best part is it's /current technology/. Face it, if it can't run Half-Life or get 200fps in Quake, your only buyers will be the people currently reading this thread. :)

Linux Geeks would love it! (if only because Linus works for transmeta). Slashdot would pimp the hell out of it, you wouldn't even need to market it :)

Hell, I'd buy one and just run it as my mail/webserver and router/firewall. transmeta already has a custom linux distribution available for it. Not only that, but it could be offered in several packages, you want WinXP on it? No problem!

The market could even be expanded to commercial vendors, it would be a viable replacement for say, the hardware TiVo uses now. Cable descramblers, Sattelite receivers, hell, I can think of very little you couldn't make this thing do.

R&D required? very little, the hardware is ALL standard, and already made, produced, and sold, not to mention it already has HUGE "geek mindshare."

I dont think thats true. The transmeta chip only deliver a fraction of the
performance
of a core like the thunderbird at the same mhz.
And you can go in a shop and buy a single chip for under 90$ (the 1.2 gigahertz
part).
But then you can get a 750mhz similare core (Duron) for 25$... thats your price.
I dont see the point in using a much slower chip like the transmeta crusoe for a
desktop/booksize PC.

just to give you an idea, a crusoe TM5600 600MHz running at max power usage
deliver
46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

>

Their is already so many core running on the x86... From the most obscure to
C64 & amigas.

X86 would be a better choice at all level... Unless this is for a PDA form factor.

>

Computer do alot nowdays in term of multimedia because of the power they have.
I'm not so sure intel/amd etc.. just develope for people to run half life at
500FPS.

Why would you want to pay for low performance?
Run x x86 version of the major OS... run Ti calculator or c64 class stuff under
emulation.

You would need native code to do software encoding on that chipat a decent speed.
Who would write all that code?

>
> R&D required? very little, the hardware is ALL standard, and already

Cant that be said for the x86 platform?

Stephan

That's interesting-   the MMU in my Atari ST (68000) was one of the
fairly easy "hack" points where you could physically attach memory
expansion cards, since all the address lines were available.

I don't know if Atari used an "off the shelf" Motorola part though.

The reason the ST was limited to 4Mb of RAM was that the MMU only had
enough address lines for a max of 4Mb.

(Atari folks loved to poke fun at PC folks and their "640K" limit-
right up until they tried to put more than 4Mb in their STs.  Same
situation-  the company "knows best".)

Ahhhh, so that's why with DR-DOS 6.0 or MS-DOS 6.0 you could load DOS
high!!
I didn't know about the extra 64K (rather, I didn't know how you could use
64K of the remaining 15 megs of protected mode.)

Typical double speak from one who can't take criticism well. What is your credential(s) and others in your organaization in regard to the publication of the Atari Online News? What credibility and why should we take face value of the content when it seems cut and paste from

```
others?  Don't you have any original thought out content or do Atari
Online just gergitates others?  Seems like a new name is in order..-)

Credentials for what?  I need credentials?  In your dreams!  Since when do I
have to prove anything to you, of all people?  I've been using Atari products
since before you were born - credentials enough for you?  A-ONE is a hobby - I
do it, as does my "staff", because I enjoy it.  As long as there are interested
people, I'll continue.  You don't like the content and format - noted.  Your
opinions mean nothing to me, for many reasons.

That's not human stupidity. If they were clearly labelled 'CD Burner' and 'CD/DVD Reader' then they probably wouldn't have put them in the wrong places.

Ralmin.

I guess I would suggest you build it based around the Timex Sinclair
ZX-80...That's worth $300, and it's really powerful too!

Well it is!
It could power a nuclear powerstation!
It must be true. It was in the adverts.
:)

Then you need to design a 300$ box that kick ass compared to a 300$ PC, otherwise you lost before you even started pouring $ in R&D.

Make sense?

My best hope is Nforce/Duron for sub 500$ systems of really high design standing.

I think if the design can fit in a 6x3x1 inch format with a color LCD a few people
would buy them. (Me included)
My casio PB1000 died, and I'm reduce to my 1liner PB100 .. a pocket 'amiga 500'
would be a nice replacement.

Urgh!

What does it say? I am guessing "(C) Microsoft Corp."

Would that be the BASIC ROM chip? I am quite sure Micro$oft wrote the BASIC
for it (and the Amiga, and probably the VIC-20).

Paul.

I just got a PDP-11. Those machines really *were* used for
controlling nuclear reactors. Amongst other things. Mine, however,
never did anything more glamourous than routing parcels for a
nationwide courier service.

Couldn't you just post it, there's not likely to be many peop's with access
to that hardware.

Can you fellows on the east side of the Atlantic help me with an early 80s question?
When I was in grad school in Mississippi, I saw on the Public TV channel (several times) two BBC series on micro computers.

One was called (I think) The Computer Program, and the other was (as I recall) Making the Most of the Micro.

Each was 12-13 episodes long.

I've tried here, through contacts with the Nebraska Public TV to see if anyone has copies, or where I could buy copies. Do any of you know anything about getting old BBC programs on tape?

Both series had the same host (a Scottish surname as I recall) and covered a number of different machine, but esp the one I don't have and would really like to have: the Acorn BBC computer.

Thanks

```
Roy

If you can port the tin reader from unix, it's already got that capability.

;)

It will even insult you, so no-one in the group has to. :)

cheers,
j

tin has versions for Amiga and Win32, but the former is a bit old and
the latter needs cygwin. Besides, tin is too un-Windows-like for
Stephan to use. He prefers to inflict Outlook Distress on everyone.
The worse it posts the happier he is. He'll be posting in HTML soon.

I haven't tried compiling a new version of tin under AmigaOS. It
might be interesting to try...

slrn 0.9.7.1 was fun!

>;)
>

He's a troll. He's not happy unless someone insults him. Why do you
think he comes here? :)

Here's another one: use a newsreader that uses a decent maximum
line-length, but you don't give a hoot for good netiquette, do you?
All you want to do is troll.

Alas. No. Can't gove you any pointers on getting copies. I don't know if the BBC even still have copies of it.

You could always enquire to the BBC itself.

part).
> But then you can get a 750mhz similare core (Duron) for 25$... thats your price.

A notebook CPU costs more than that, heck I can't even find a price for
comparison. You just couldn't use one of those furnaces in a book-size
unit.

> I dont see the point in using a much slower chip like the transmeta crusoe for a
desktop/booksize PC.

But it would be a HELL of a lot faster than the 68000/Timex
Sinclair/6502 relics others are suggesting, and it runs without a
heatsink. You ever felt the CPU in a notebook? imagine the temp a
thunderbird would be!

> just to give you an idea, a crusoe TM5600 600MHz running at max power usage
deliver
> 46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

Thats under the x86 codemorphing layer with the optimizations set to
"don't cache code", The Crusoe is a tricky beast to benchmark,
especially against it's own codemorphing layer. The codemorphing tends
to cache the benchmark loops giving unrealistically high scores, so for
simplicity, it's turned off.

> > Can you imagine UAE ported to Crusoe as its code-morphing layer?
> > incredible.
>
> No so sure about that...

It would be wild, a codemorphing layer that abstracts a 68040, and the chipset! come to think of it, I wonder if UAE would even be needed?

> > Modules could be made for just about ANY old school CPU/platform, and an
> > OS wouldn't need to be developed for it, as it could run these platforms

>
> Their is already so many core running on the x86... From the most obscure to
> C64 & amigas.

But those are "emulators", Crusoe's codemorphing is a much different
beast, even x86 is just "codemorphed". c64/Amiga's are running on top of
Windows/linux on top of x86. The Crusoe wouldn't need a host OS.

> > Marketing would be a piece of cake, as you could use it from anything
> > from a Kiosk to a webserver, an Amiga emulator to a Unix portable.

And it looks like they beat me to it, it's now available, albeit at a
higher price, running linux 2.4.5 w/Netscape 4.7 (shudder)

> > Computer do alot nowdays in term of multimedia because of the power they have.
> > I'm not so sure intel/amd etc.. just develope for people to run half life at
500FPS.

On the contrary, they'll market them for dumber things, like Intel
saying it's "New Pentium 4 processor will enhance the web" and going
on about how the internet will be faster. I always get a kick out of
that :)

> > Linux Geeks would love it! (if only because Linus works for transmeta).
> > Slashdot would pimp the hell out of it, you wouldn't even need to market
> > it :)
>
> > Hell, I'd buy one and just run it as my mail/webserver and

> > available for it. Not only that, but it could be offered in several
> > packages, you want WinXP on it? No problem!

> Why would you want to pay for low performance?
> Run x x86 version of the major OS... run Ti calculator or c64 class stuff under
emu

Because emulation would /be/ low performance, the Crusoe running a
platform under codemorphing is faster than any emulator I've ever seen.
Show me an x86 emulator that can run Windows faster than the Crusoe can
under codemorphing/x86. Remember, this is a hobby box, if I want to toy
with an OS, I want to run it natively, (or a codemorphing facimile
thereof.)

Plus it's upgradeable (the codemorphing), meaning the platforms it can
morph will increase over time.

> > The market could even be expanded to commercial vendors, it would be a
> > viable replacement for say, the hardware TiVo uses now. Cable

> > descramblers, Sattelite receivers, hell, I can think of very little
> > you couldn't make this thing do.

> You would need native code to do software encoding on that chipat a decent speed.
> Who would write all that code?

In the case of the Tivo, it's already been written. the Linux/x86 package is already available customised for the Crusoe, tailored by Linus Torvalds himself. In the case of the Satelite reciever, you can find the GPL'ed code from a link off of www.satmatrix.com. Kiosk software has already been made available for the Crusoe under GPL, so has PDA codemorphing for the Palm platform.

The beauty is, if code isn't available, as long as you can produce the codemorphing layer, you just reuse your existing code! Case in point, Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't x86, it simply pretends to be through abstraction via the codemorphing. Hence Windows can run "natively" on a CPU it isn't written for.

> > R&D required? very little, the hardware is ALL standard, and already
> > made, produced, and sold, not to mention it already has HUGE "geek
> > mindshare."

> Cant that be said for the x86 platform?

Only for the case of x86 hardware meant to run x86 software, the Crusoe isn't limited to x86.

As for the "Geek Mindshare" I think a Crusoe captures more mindshare among the HW geeks than x86 does.

And the Ohio Scientific systems, and the Apple II and, and, and...

Actually the OSI BASIC was an excellent little interpreter. With only
6 digit floating point precision it was extremely FAST (who cares
about .000001 accuracy- I was just writing video games), it was
easily extensible and it only had a few bugs.

Those were the "good old days" when Microsoft was your friend.

Actually the 750mhz part should run 'cool', also you can run it at 400mhz and
remove on chip active cooling?.
I put 533mhz celeron in booksize computer and they where fine. a 750mhz duron
would be cake.

>
> > I dont see the point in using a much slower chip like the transmeta crusoe for
a desktop/booksize PC.

Yes, I would choose a rusoe over a 68000, no problem here.
For low power... I kind of like the strongarm.
I dont really have a sweet spot for transmeta effort, I dont see where it really
fit in the market.
I also see that they are not doing well at all... Could be riding the economic
wave, or just problem
grabing some of the cpu market.

>
> > just to give you an idea, a crusoe TM5600 600MHz running at max power usage

In the end , MMX/SSE/multimedia/3d stuff will probably run many fold faster on a slower mhz p3
then a crusoe chip.

At this point I would guess that a mobile p3 can render more then a crusoe using the same amount of
power... Using less power ut performing less is not always an advantage.

>

Their is a diference betwen reformating code (UAE is already doing its own type 'codemorphing')
and doing cycle precisise timing on virtual register set of custom HW on top of that.
Their is alot more stuff in UAE then what transmeta is doing, thats why I never caught on the hype.

>

> Windows/linux on top of x86. The Crusoe wouldn't need a host OS.

Does codemorphing support handling of strobe registers? I dont think transmeta
support emulation of something as complex as the OCS HW register set.
The floppy controler register would need 'HW logic' emulated... etc... Not an easy task.
So you would need to show big revenue to spend all that R&D to emulate decade old HW.

> > > Computer do alot nowdays in term of multimedia because of the power they have.

> on about how the internet will be faster. I always get a kick out of
> that :)

It run flash smoother, it handle better codec like mpeg4 and real, complex web
page scrool
smother, it will give higher frame rate in complex java gfx applets, etc, etc...
So in effect, yes the web to an end user look smoother/faster... He can navigate a
bit faster,
scroll complex page with ease.
Use a DSL conection on a pentium clasic and then a pentium4. If you visite media
rich web
page you will see a Dramatic diference.

So I can see people getting a new computer when they get braodband.

What OS worth anything doesn't run native on a x86? :)
And how much power do you need to get z80, 6502, 68000, etc.. emulation going on
a gigahertz clas thunderbird?

>
> Plus it's upgradeable (the codemorphing), meaning the platforms it can
> morph will increase over time.

I dont think they have yet to emulate a pentium MMX, they just emulate the basic
486?

>
> > > The market could even be expanded to commercial vendors, it would be a

What codec did Linus code nativly for the crusoe?!!?!?
Do you have a link on what is in a Tivo box?

>
> The beauty is, if code isn't available, as long as you can produce the
> codemorphing layer, you just reuse your existing code! Case in point,

Thats the whole problem... The chip is just to slow.

> Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't
> x86, it simply pretends to be through abstraction via the codemorphing.
> Hence Windows can run "natively" on a CPU it isn't written for.

Like UAE convert 680x0 to x86. I can take a fresh copy of Amiga OS from a box and install it on a PC.
The thing is windows will expect some kind of common PC chipset/bios support if its to ru nout of the box... I dont see the point. Get a mobile P3 to run windows, it will be faster. Support native MMX/SSE at full speed.

>
> > > R&D required? very little, the hardware is ALL standard, and already

> isn't limited to x86.

Aside hacking a new processor, or fiddle around... why would anyone actually morph to something else then a x86?
For example, can the sony laptop also run MaxOSX with a PPC version of the crusoe code morphing?

>
> As for the "Geek Mindshare" I think a Crusoe captures more mindshare
> among the HW geeks than x86 does.

I'm a programming geek.. and I got loads of tools for the x86. I also love processing power.
The crusoe is a just a processor that got its core designed to be emulator friendly... But aside emulation is doen't have much to it.

Again, I'm not a fan of that chip because I see no use for it in all common
computing form.
PDA, laptop, bookside, desktop, workstation, server... All have better processor
already there for
the picking.

Stephan

Real newsreaders even let you change the line length as you type.

Well, I guess that should actually be, "real OSs," since the key to that is being able to change prefs on the fly while you use programs.

Multitasking: try to imagine it.

> For the sake of argument let's suppose you could design a next generation
> $300 homecomputer. The goal is to make a userfriendly machine for general
> use and for hobbyists. How would such a system look?

I may be late to the thread, but anyway...

I don't think that people will be willing to pay $300 for an appliance (as such a computer would be). You have to look at what the current market wants. There are a million and one Internet boxes (the Bush Internet TV is one at �79, or about $100) that do Internet, email, etc. Not much use for writing a letter or playing games though.

Assuming that you have been given a Government contract to make sub $300 boxes for poor people to enable the Internet revolution and increase education,etc (a realistic modern aim?) then what would you want?

Integration is the name of the game. So is simplicity. It won't have a DVD drive, but it will have a CD drive. It won't have a 40GB HD, but it might have end of line never-sold 5~10GB HDs. It will have built-in modem and ethernet. It will have built-in graphics and audio. It must display to a TV, but a monitor is an option. Expansion ports kept to a minimum (4 USB, no serial, parallel, etc). Internal expansion not necessary. CPU power needs to be adequate, not good.

If you are building 1m boxes, you would sign a contract with Asus/ABit/etc to get low end motherboards with the features that you want only, in the form factor that you want. Use a cheap processor (in quantity, the Via C3 would be good - I bet you could get 600MHz C3 processors in quantity for ~$25 each). Integrated motherboard would be $40 with a $15 chipset (SiS630) and minimal components. Hard drive would be ~$50. CD ~$20. No floppy.

Motherboard (+modem, network, audio, graphics): $40
Processor: $25
Hard Drive: $50
CD: $20
Case (custom): $20
Keyboard: $5
Mouse: $5

As for the operating system - a free one would make sense, however a simple for dummies interface should be employed. The Linux kernel could be used, with a graphical interface that lets the user run applications and set up the device, but isn't a scary UI. Big icons on the screen, one for each application. Basically the Palm launcher I reckon. Modified applications could be used that didn't prompt the user about where to save the document, but just saved it safely, and when you wanted to open a document, it would just show the user the list of documents that they had previously created. Disable downloads from the Internet except from the device makers, where new apps can be downloaded only (use a special tool, perhaps).

On the other hand, just use a Pace Digital TV set-top box, with built-in PowerVR technology (a la Dreamcast). As non-digital TV will be eradicated in about 6 years anyway, why not lever a device that everyone will need in their house at one point or another?

Graham

> That doesn't seem 'far too expensive' to me. Those processor rocks!

I would also say that this was a great processor for a device.

> > As OS? (Linux is a dead giveaway, but there also other OS's out there)
> Linux, why not. .. oh yea. You mentioned userfriendly. so thats a nono.
```

Linux is a kernel. The "Gnome OS" and the "KDE OS" are not userfriendly enough! Get the Linux Kernel (or FreeBSD kernel, etc), get QT embedded or GTK/Framebuffer, and create a custom, Palm UI like, interface that is simple to use.

> > Amount of memory? (RAM and ROM)
> 256meg RAM. 8K EPROM

128Meg will be enough - $9 in bulk apparently. EPROM?

> > Graphic and Sound?
> Geforce2

Waaaay too expensive for a $300 device, unless you were going to sell it for a $200 loss (XBox).

> > Network capabilities? (internet capable)
> 100BT

Part of most integrated chipsets anyway.

> > Plug in capabilities (remember you're making it as cheap as possible so
> > modems, CD-Roms, HD's are all extras)
> CDRW

Not for a $300 device. Depending on the market for the device, either a DVD drive or a CD-ROM.

> Take a look at the XBox.

$500 of hardware sold at a $200 loss. With out-of-date processors donated for free by Intel. The chipset alone would cost $120+ (if a GeForce 2 MX enabled chipset sells for $90 [nForce], then a GeForce3.5 enabled chipset will cost at least $30 more - more like $50 more). Motherboard is CPU, Northbridge, Southbridge, 4 USB ports, Ethernet, Modem, and IDE channel - very cut down to reduce costs.

Graham

It exists already (although the Dimm version is still expensive,
but the Simm version is $300!)

> software base that no new computer could challenge for decades.

"decades"? Slightly optimistic perhaps. Look back a decade. Find a good software base. Is this still a good software base? No? I rest my case.

> ROM is nice, but restrictive. Atari was hobbled by the difficulty of
> releasing bug fixes to its TOS operating system because the OS was in
> ROM. (Well, that was one of the reasons.) But it was VERY nice to
> have the system boot in seconds.

Dodgy OS. If it was better designed, it would be able to have been patched in software after the boot process. (see Setpatch)

If it was used at 3-Mile Island in March 1979 it would be a star!
Or at least notorious. There's nothing like having the morning
traffic report contain a reference to a nuclear catastrophe.
That'll wake you up.

The problem is it's a niche market, albeit an expanding one. They don't
even plan to break even for 5 years. I don't ever see them taking over

any desktop market, however, for low-power applications with platform
legacy requirements, you can't beat em.

Oh, yea, no question about it, but then, this isn't a desktop machine
we're talking about. x86 on the desktop is king.

> At this point I would guess that a mobile p3 can render more then a crusoe using
the same amount of
> power... Using less power ut performing less is not always an advantage.

Not on a desktop or server machine, but then thats not where any sane
person would dream of sticking one of these anyway. The goal is a
slightly higher platform abstraction, and slightly lower power
consumption.

old HW.

Not any more than it took them to write the codemorphing abstraction for
x86, from what I hear, the x86 architecture was a real bitch with all
the registers they had to emulate, I think the reason they emulate a 486
is because those registers were documented. That was the reason NASA
gave for using the 486 as well, access to documentation. Transmeta then
had to provide a BIOS as well, as part of the morph abstraction.

A big part of the R&D has already been worked out by others already, I'm
sure AROS/UAE technology could be used. I know UAE is free under the GNU
GPL license, not sure about AROS.

Sure, but what they said was that the SIMD instructions new to the P3
would speed up DSP code, making software modems faster. I think alot of
people somehow thought that they could upgrade their dial-up connection
by upgrading their processor. ;) It's true the SIMD instructions do
include DSP specific instructions, but I doubt anyone would notice on a
dial-up software modem anyway, and I don't think the network card
drivers will benefit from SIMD at all, since there's no DSP taking place
anyway.

;) If it's meant to run Windows/Linux/Solaris ect. and sit on my desk,
give me my Athlon 1400/266 768MB DDR MSI-K7T-Master w/raid box anyday,
but this is a smaller, possibly battery-only portable hobby thing here
meant to be multi purpose webpad/PDA/portable what have you, it would
have to be very flexible in what you could do with it and where you
could bring it, so as not to become so "niche" that noone buys it.

The reason I see Crusoe as a good match for a project like this is that
it sort of combines a dozen or so pre-existing niche markets into one
market that could be sold the same hardware. There's already a market
for a low-power webpad, and people are willing to pay $2300 for them
(check out Slashdot's submissions for saturday) there's already a market
for PDA's, and Crusoe is faster than anything in most PDA's right now.
portable units for inventory and UPS/shipping are already being sold,
for anywhere between $400-$1000.

Hell, Transmeta's Crusoe, running at 633MHz, is already being used in
very-low power servers, running on 7 watts (idle) to 15 watts (max load)
http://www.transmeta.com/everywhere/products/servers/rlxtechnologies/
rlxtechnologies_system324.html

(this link may wrap, my newsreader sucks)

> Do you have a link on what is in a Tivo box?

http://www.tivo.com/linux/index.html

They released their power-PC linux mods as per the GPL.
Since the mods were developed by TiVo themselves, they already have the
codec source, all they would need to do is recompile for Linus's
"Transmeta distrobution" (maybe not even).

If Transmeta releases a PowerPC codemorphing layer (or someone makes
one) they wont even need to do that. This would probably interest TiVo
greatly, as they already stated they wish to make their money from
selling the subscription, not the hardware.

> > The beauty is, if code isn't available, as long as you can produce the

yes for a desktop, but for the applications and the specs of this
project, it far exceeds what the alternatives can do, and will still be
in the "desktop speed ballpark", unlike a z80/68000 ;)

> > Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't

and
> install it on a PC.

You mean you can install windows, install UAE, install AmigaOS, if you
were buying something specifically to do things like run AmigaOS, why

would you fudge around with windows? Heck, the best way to have a
desktop Amiga is to get an Amiga desktop anyway ;)

> The thing is windows will expect some kind of common PC chipset/bios support if

crusoe code morphing?

The Sony laptop was made as an x86 laptop, this project isn't about
making a Windows98 laptop, they exist already.

> > As for the "Geek Mindshare" I think a Crusoe captures more mindshare

already there for
> the picking.

The project needs something that can do them all, at whim. No general
purpose device will ever outperform a specifically desined for a purpose
device, thats why we use 1400MHz Athlons to play games and 33MHz
Dragonballs to sync our palms. but neither one of those would be very
good at both ;)

You can play Quake on a Crusoe, and still remain at only 2 watts. The
same beast will run linux, and can scale down to less and be walked
around like a PDA.

It's not something that would replace the desktop, but an extension of
it, replacing possibly our webpads, mp3/Rio's, PDA's, pagers, inventory

interface units, ect with a common device/platform. It might even
slightly eat into the laptop market as alot of people only "need" a
laptop for trivial things anyway.

This is now, OEM windows in 5 packs can be gotten from Ingram Micro for about $80, and Ingram is one of those vendors thats usually more expensive, but they have everything.

We used to be able to sell OEM Windows with just a Mobo or HDD, but now they require a full booting machine (or parts that could make one)

The x86 is nasty that way... its *backward* compatible that to make something 100%
x86 compatible take a huge effort. (I also admire AMD for this... and in turn
Transmeta)

>

I'm not sure their is a market... but if their was, AMD could also make their
processor
emulator friendly by adding so facilities to it.?

I dont think you will see benefit at that level (packet thruput). Maybe a tiny,
tiny bit
by using the cache control insruction. But nothing to advertize about.

The web is vague enought that intel can be doing this compain in reference to the execution
of the web data received.

If it will run on batery forget what I said.... I'm intetrested in the strongarm, possibly crusoe native?
The second part here is compiler technologie.

I use to have a PB1000, a programable 'calculator'. Nothing like a TI... it was really like a small 8bit
computer... But it died. and if I could find a <300$ replacemtn I would jump on it.

How about the StrongArm? isn't it lower power and pack a nice punch?
For those device you dont really need code morphing unless you dont have the
right compiler tools.

That look massive! I really didn't think anyone would use that processor for
server level design.
Nobody would put that much $$$ in R&D without having studyed the market well...
humm. I must be missing something.

My original comment was about stuff outside the OS. For example software video
codec.
You need those to run native to get realtime, usually assemby codec. So you need
to man
power to get an mpeg2 decoder (encoder)...

I would imagine the best for them would be to reuse common PC parts?
Maybe a basic microATX MB modifyed a bit with a custom bios?

I would imagine that someone could build a 68000 today that consume very little
power and runned at high mhz?

How about the .9 volt .5 watt Mobile pentium3?
Or the ultra low voltage mobile celeron (with mmx/sse)?

The 600mhz part is not cheap, but its still under 150$.

>

I think its going to be very, very hard for transmeta to take this place.
But not impossible. If they can impose themself as the standart, then they can
live
those 5 years to get profitable.?

Stephan

The xbox cannot cost 500$ for MS to build... the lose probably include all the QA,
R&D it took.
They probably spend <300$ to build the xbox... its cheap stuff when you build them
in the millions.

You can find some decent complete motherboard retail single unit for <70$ (Thats
with audio, 32meg video, the works)
in a retail package etc.. Those probably cost 40$ to build. (Its not geforce2
based, but a Savage4 core.)

The nForce chipset in a year might cost <50$, and people will build <100$ MB using
it... Anyway, I'm planning

on building a <500$ PC using this chipset when it comes out. So I'm sure a big manufacturer can build a PC
for 300$ mass produced.

Stephan

Tech TV had a segment on midi software solutions on PC/Mac hardware and dissed the Atari cutting edge solution which was not mentioned. It is common knowlege that 1990 era Atari midi solutions has revolutionized music composition and has no peers compared to the half bake attempt Apple II, Atari 4-8 bit and older 1987 Mac solutions.

Oh well, Tech TV is not perfect considering that folks who could not make the MacWorld Keynote had to sit through a somewhat flawed live broadcast with stupid commentary according to comments posted on the web. Oh well..

sinclap!

In article <tlpsk6fkn0qj16@corp.supernews.com>, tthai@mindspring.com
says...

> The x86 is nasty that way... its *backward* compatible that to make something 100%
> x86 compatible take a huge effort. (I also admire AMD for this... and in turn Transmeta)

Heck, even Intel had a hell of a time with the transition from 486 to pentium(p54c/p55c-mmx), they said there were something like 14 debugging registers that were "left out" and caused a few problems, some quazi-ops were dropped, and they had to abort those plans to support those 486"upgradeable" boards with the extra pins that were pentium ready.
(a small price to pay for feature-creep though)

At least the x86 legacy stuff does have an end in sight though, the 64bit CPU's won't be encumbered the way x86 was.

> I'm not sure their is a market... but if their was, AMD could also make their processor
> emulator friendly by adding so facilities to it.?

They could I suppose, but being the Athlon would do the abstraction at a higher level, I don't know how much more effective it would be. (In a desktop where you have watts to burn however, its a different story)

> If it will run on batery forget what I said.... I'm intetrested in the

> jump on it.

I miss the simplicity of the 8-bits, I held on to my Vic-20 for years using it as a hardware controller for EPROM burners and whatnot. One side of the room I burned them, and the other had UV lights to erase them (remember those?;) My neighbors must have thought I was growing pot.
 What was so magical about our first 8bit computers that made virtually everyone who owned them learn to program them, as opposed to today, where people are so cynical about their machines? We used to "Love" our computers in a way that won't happen again, it seems. Gosh, did I say that? I sound like an old fart ;)

I'm totally in the dark when it comes to the StrongArm, I know it's made
by IBM and I hear they have a loyal following in Europe. That about sums
it up as for my knowledge there ;)

Actually I'm not sure if Tivo uses software or hardware mpeg, but
between Tivo and Transmeta, I'm sure they could whip something up.

> > If Transmeta releases a PowerPC codemorphing layer (or someone makes

Or even a retrofitted Sony laptop motherboard maybe (gawd I hate laptop
hardware though ;) microATX would be good, with video/sound onboard,
maybe using laptop IDE hard disks, External 'wallwort' powersupply,
internal battery.

> > > > The beauty is, if code isn't available, as long as you can produce the

If they could, I know some people who would trick out an Amiga like
you've never seen before ;)

I'm not sure how much power the P3 system as a whole uses yet, havent
had a chance to play with one yet, I'll have to look.

> those 5 years to get profitable.?

They've got one thing going for them, noone else is after this market,
it's currently dominated by hundreds of 'submarket' solutions, Palm,
Rio, etc, and Transmeta doesn't even necessarily need to compete with
them to controll this market, they just need to become the main vendor
for the tribes currently camping there.

Then again, Intel might just decide to squash them.

It's a worldwide conspiracy to intentionally ignore every accomplishment

Atari ever made. They don't want to admit that a game company had so many innovations first. They know about it, they just don't mention it on purpose.

Umm... you're using the wrong end of the telescope.

A decade ago there were several choices of competing Operating Systems.

Now for all intents and purposes there is only one.

(MacOS is a far distant second.)

With the kind of momentum behind the current OS, it's unlikely that any other OS will be able to overtake the existing software base for a long, long time, if ever.

Go to the local CompUSA and check out how much shelf space is devoted to native Linux apps.

I rest my case.

Why not using 80386, then ? It has it all- MMU and segmented adressing, and one even gets a several 100's bytes of cache ? ;o)

Regards,

Branko

I seem to recall that the Mandrake 8 graphical installer needs something
like 64Mb of RAM and having less is pretty much the only thing that I've
ever seen cause it to bomb out.

And Red Hat sucks big time. Even the latest version.

The way that I differentiate between 'script' and 'compiled' languages is, roughly, this...

If the compilation (and linking) step is commonly separate (C, C++, Pascal, Ada...), it's a compiled language.

If the compilation step is integrated into the runtime environment (Perl, Python (I think)), it's a scripted language.

If the compilation step is omitted altogether (BBC BASIC and purely 8-bit BASICs), it's an interpreted language.

Why buying a PC, topic say, "if u could design" not what would u buy..

Janez

WHAT?!?! 24 address lines gets you 16 megabytes. He's taking 4-8
The fact is that the Mac Plus had 24 address lines and 4 megs. - and that was in 1986!

: or 68030 processor and bypass the smaller bus.

Perhaps I'm oversimplifying things here but, assuming 1MB pages into this secondary memory, wouldn't an 8 bit register attached to a decoder suffice?

As per the 68020 and 68030: it sounds great wrt speed and functionality, but what would be the cost in complexity (for the end user, of course)?

This is, in essence, a machine which I would want the user to be able to pull apart and modify, if they so desire, without a degree in electrical engineering. I have seen people modify the old 8-bitters, and there are people who will modify (for example) the TI-89/92 calculators (which are based on the 68000). I have not encountered people who go to such trouble for i386 or later, or the PowerPC. Just peeking into the processor manuals for those beasts is very intimidating. I can hardly imagine what a complete set of documentation for a modern PC would look like, if such a thing existed.

Byron.

No it is only you who is insane. Not to mention foll of smeg. Nowhere on this planet can you get a p3 at that price, unless your buying stolen property from a fence.   Btw, better recheck your clock speed too, the 1.5 gigahertz processor systems aren't readily available yet. oh and don't forget, where I live, retail on windows is $300 by itself. Are you really so STUPID to believe any vendor will sell you windows and give you the hardware on which to run it for FREE?

get a life.

WRONG WRONG WRONG!!!!

Go check the 68000 Data book. For that matter take a course in basic digital electronics. A 24 bit address bus will support up to 16megabytes total with no extra tricky hardware requireed. Btw, the data path is irrelevant to amount of ram a cpu can address, data bus is strictly for moving DATA, wider will give shorter read times for large values. the Address bus determines how much memory is available without resorting to such things as bank switching & so on. Btw, the 64 to 256 megs of flash mentioned could be addressed with some additional hardware. This is not "pie in the sky fantasy", but the common techniques used on apple II, commodore & atari 8bits that supported more than 64k of ram + roms.

I'm not subscribing to csa8bit to receive all those info I don't want to read. Does this thread ever end? Or would you be so kind to stop crossposting it with comp.sys.atari.8bit? How much will it me cost to let you do so? :-)

```

An unfortunate design defect of the 80386 is that it can't
execute 6502 code.  Maybe if Intel could get its sh* together,
it would design a chip that we here at comp.sys.cbm might
actually be willing to try out.

Dude. He said he wanted 64 meg to 256 meg of RAM. A
68000 with only a 24 bit address can't address larger
memory schemes.  16 meg would be the limit of a 68000.

Apple crippled the memory on the early machines. The later
LC had 10 meg of RAM available although 6 meg was set
aside for ROM. The Mac Plus was even worse. It was limited
to 4 meg because Apple didn't let the Mac support larger than
1 meg simms. It only had 4 simm slots. To go larger it had to
support larger simms like a 4 meg simm. However, on the Mac
Plus/SE, Apple set aside 8 meg of address space for ROM.   This
limit was not broached until Apple decided to make 68020 based
machines with larger address space. He is wanting 64 to 256 meg
of static RAM.

A vendor, however, will be paying for OEM Windows, not retail. The OEM
version is usually much cheaper, but with stricter licensing (i.e. must be
sold with a computer, can't be installed on another PC, etc.). So, figure
US$50-$75 for Windows, maybe even less.

You could say the same thing about e.g. Javascript too: it has a full set of bit-fiddling operations, numeric operations, string operations, and it's even object oriented. But it's still considered a 'script' language....

The reason these languages are called 'script' languages is probably because programs in these languages usually are interpreted rather than compiled.

"But Basic is interpreted too!!!" I hear you cry. Yes, it used to be, but that was a long time ago - today it's usually compiled. However, it is still sometimes interpreted - one such example is

VB-script.

Is this after the new licensing scheme comes into effect?

Python can be either, just like emacs Lisp. Of course, it 'compiles' to a byte-code which it then intreprets, it's not *real* compilation.

Perl also has seperate compile and execute phases, although at present you have to do truly evil things to presuade it to spit out the byte-code.

However, I think that that differentiation is bogus. It means that most implementations of Lisp are not programming languages. It means that if (god forbid!) you were to run C in an interpreter, it would not be a programming language.

Oh sure, throw in this non-standard bit of chaff here($), and that
non-standard bit of dross there ($$) and pretty soon you find out why
things like "Atari clones" cost a small fortune. Some sort of decoder
here, and a bank-switcher there, and we're not talking about $300
retail any more.

And how much did that 192k card cost?

And how much would that translate into today's currency?

A 48k RAM expansion board for an Atari 400 retailed for $150, which in
todays dollars would break this project before it got started.

Low volume, non-standard, high cost.

It's called "Market Research".

It's part of the process of finding out if there is already something
on the market at the same or lower price point.

If someone is already making something like "The Wonder Widget" and
selling it for half what it would cost YOU to make your version of a
Wonder Widget, it wouldn't make any sense for you to try to sell one,
and it wouldn't make any sense for anyone to finance your business.

If Gigahertz computers still cost $3000, it might make sense to try to
come up with a $300 computer that would do a lot of the same things.

Unfortunately, as some of the messages here have pointed out,
Gigahertz computers now cost as little as $350, making a "New"
computer based around some arcane, non-compatible, possibly obsolete
CPU chip, with no software available, and a user-unfriendly operating
system an awfully "hard sell" in the marketplace.

Companies like Atari, Amiga, Sinclair, (fill in the name of any one of
dozens of others) and even Apple have found out the hard way that just
having a "superior" box won't do any good at all if no one buys it.

The question is, who will buy this new $300 box?

So where on this planet do you live?

Check (as I said a few dozen messages ago) www.pricewatch.com
and find out how little a PIII Gigahertz SYSTEM really costs.

(Here's a hint: $418, INCLUDING Windows OS)

Or go for an Athlon Gigahertz for about $300 (again INCLUDING
Windows.)

A life is at your own discretion.

Ignore it, it'll go away eventually.

It actually DOES have relevance to the Atari 8-bit world, as the inspiration for designing a new inexpensive system harkens back to the venerable Atari Home Computers that brought "Power Without The Price" to the few dozen people who ever bought one.

(and yes, I have an attic full of them myself)

There's a lot of nostalgia for the "simpler times" and the "simpler machines" which populated them.

I get nostalgic every time I think about spending $550 for a floppy disk drive.

Unfortunately I doubt anything is ever going to bring those times back again.

A further "design defect" of the 80386 is that I don't believe they're
being made any more.

I sure hope nothing brings back those $550 floppy disks again... ;-)

But he mentioned 4-8 megs of RAM, which is VERY doable with a 68000, and the 64-256 as battery backedup RAM disk for documents. As RAM disk, the address lines aren't the issue. You can have 1 meg RAM disks with the Apple][+.

You didn't read what he said very carefully:

Hardware:
- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution,
  high contrast, black and white is fine
- semi-portable design (something which can
  be moved while I'm working, but not something
  which I work on while moving)
- 64MB to 256MB RAM with battery backup, for
  storing documents. Or use flash memory if
  it is cheap enough.
- HD 3.5" floppy, for communicating with my
  other machines

And, in his reply he said:

> Then throw in some sort of decoder for the 64-256MB chunk. Since

> it is not the main memory (that would be the 4MB chunk), it should
> not make much of a difference.
>

So, 4-8 as main memory, easily accessed by a CPU with 24 address lines,
and 64-256 battery backed RAM disk, which has little to do with address
lines.

68000, 80286 (or higher), or 65816 could do what he was thinking, as CPU.

This is true but the other memory is still memory and has to be accessed
in some manner. Plus we are talking about a sub-300 dollar machine
and any custom logic is going to cost money.

Oh really. You still have to get stuff in and out of your RAM disk and it
takes address lines. You will still need an address decoder to be able
to switch banks of RAM in and out of main memory. It doesn't happen
like magic. A real address in memory must somehow find its way
to the correct bank of RAM that you want to access. It is a real
pain in the butt doing it that way. The Apple II couldn't address

more than 64K or RAM at any one time anyway. Programs
never exceeded the size of memory space. The 68K is a totally
different animal. Programs can be huge on a 68k machine. I don't
think you would want to bank switch RAM to run a program.

If you want something all singing all dancing then even if I could design something better than a PC I haven't the time to write all the software to go with it.

If however you want to just make a computer for the satisfaction of saying "I made that" then I would make a clone of an antique home micro. The hardware design would be feasible, and you wouldn't have to write lots of software for it. The hardware could fit in fewer smaller parts than the originals, with modern memory chip sizes.

A few candidates would be:
ZX81 in PLDs or FPGA (done by Ian Bradbury and Bodo Wenzel respectively see http://www.howell1964.freeserve.co.uk/ZX81/ZX81.htm)
Commodore C64 in FPGA (done by Jeri: http://www.geocities.com/cm_easy/ - impressive!)
Acorn Atom / BBC micro / Atari 800XL / Atari ST / TRS80 / Spectrum in FPGA

It can emulate it, probably much quicker than 1 or 2 MHz 6502 or Z-80H
You wait a year or two and Celeron will be cheaper than 6502 ;o)

Regards,

Branko

The older machine has 64 Mb of RAM. Maybe it needed just a trifle more.

But my point was that any OS that's specifically designed or customized to work with a very narrow range of hardware variation could be successful on these supposed $300 machines.

I wouldn't be too surprised to see that. -

I just did a little poking around to check on prices of Motorola 68020 and 68030 CPUs, just to see how they would affect the cost of a $300 system.

Allied Electronics doesn't even stock them any more, but for only $200 they'll order you a 33Mhz 68020 chip.

That's almost THREE times the cost of a 1Ghz Athlon right now.

(And that's their QUANTITY pricing. Ouch!)

Supply and demand at work.

BobR

Really. I have a 1 meg RAM card in my][+. There were a number of such cards sold. And some were battery backed. 16 address lines, 8 bit bus and 20 bit address space. Surely you have seen such in ads. And since that was done with an 8 bit 6502, I'm sure the 16/32 bit 68000 could do it too.

> You still have to get stuff in and out of your RAM disk and it

RAM disks aren't part of your main memory. DUH!! Do you bother to read any of the posts being made? The software that organizes the RAM disk is in your memory, but as far as the CPU is concerned, that chunk of RAM is no different than a hard disk or floppy disk. Or do you wish to assure that disk drives are also part of the CPUs memory, being switched in and out?

> It doesn't happen
> like magic. A real address in memory must somehow find its way

> never exceeded the size of memory space.

Wrong! Programs often exceeded memory space. It was called overlaying. Ever hear of WordStar? And yes, that was a Z-80 program, but 6502 programs did the same thing. The overlays were on disk, called in to replace a part of memory (much like bank shifting, but much, much slower). With a RAM disk, exactly the same thing happened, only the data/code was stored in RAM outside the memory space of the CPU, and organized as a RAM disk.

The Coleco ADAM did this, so did the Atari 130 XE. There were plenty of boards like this for S-100 computers using the Intel 8080 or Zilog Z-80. In fact it was the best way to use CP/M Wordstar. Some would say, the ONLY way to use WordStar.

> The 68K is a totally

No one was talking about bank switching.
He was talking about a 64-256meg battery backed RAM disk though.

Bob Retelle (bobr1@provide.net) wrote:
: The question is, who will buy this new $300 box?

Perhaps nobody. We are simply playing with ideas here.

Or, perhaps, somebody. Look at the groups this discussion is taking place in. How many people would even consider using these machines in an era of GHz computers? After all some of these machines run at a poky 1MHz, and are crippled by 8 bit wide words. (My Apple II fits in that category.)

Apparently a large number of us still use those machines. Some of us still buy those machines. Sometimes we pick up the original thing (Apples, Atari's, Commodores, and so forth) for a bargain. Sometimes we pickup devices which have similar, embedded processors. The TI graphing calculators use the Z80 and 68000 processors. These calculators appear to fit in the $80 to $220 Canadian range, and I'm willing to bet that there are good margins.

So maybe there is a market. But that still shouldn't prevent us from discussing ideas.

Byron.

> in the butt.

I did say that they would have to be bank switched. It would still need an address range to move the data to like that extra 64K on the 80 column IIe card does. It is bank switched. What I meant in saying they didn't exceed the size of memory was that only 64K could be accessed at one time. To get more memory requires the programmer to bank switch the program or to swap code out and pull it from the Floppy/HD in his code. No hardware or OS automatically handled that on the Apple II. The early PC's like the 286 had all kinds of odd ball memory due to the 8-bit legacy of the 286 processor. They still had 64K code segments and any one chunk of code had to reside on a 64K bank. You don't want to place a loop on two banks of memory because that would require you to bank switch constantly.

> For software like a RAMdisk, it's not a pain in the butt at all to use
> bank selection. No different from selecting what sector of a disk drive
> to read in a driver for an ordinary electromechanical disk.

While that is true, it requires special coding on the part of the program. Not all Apple IIe programs supported the extra RAM and it was the minority that did. The program had to be aware of the memory. Some smarter 8-bits using the 6809, had a MTU unit which would take care of the bank switching. They had a smart operating system called OS-9 that knew how to handle the memory plus it had a hardware chip which handled a lot of the memory management.

The other way was using the Chain command in the older basics which would remove the app in memory and load the referenced code. Not all Basics had that command. That made it a bit easier but on the Coco, it required the programmer to write routines to access the memory. It was not handled automatically by the OS.

Bob Retelle (bobr1@provide.net) wrote:
: Allied Electronics doesn't even stock them any more, but for only $200
: they'll order you a 33Mhz 68020 chip.

That price is insane, and I suggest that you shop around more. And focus on the 68000, which I have seen in calculators costing about US$120. I am quite confident that the manufacturer is not producing these at a loss, and likely have a healthy margin. One of these calculators served as my inspiration, only with boosted I/O capabilities, much more open design, and with the OS in ROM where it can not be damaged. (I pulled mine apart, and it used a Motorola 68000.)

I will not argue withthe PB100 hypothesis though, as I am a Mac user.

It is worth noting though that only parts of the Macintosh and IIgs operating systems are in ROM. For the machine to be in a useable form, the rest must be loaded from disk (the Classic was an exception, but even it does not spring to life as an Atari ST would). Indeed certain drivers required to access the original Macintosh hardware do not appear to be in ROM, including part of the serial driver, the print manager, and the AppleTalk manager. (From Inside Macintosh Vol. I.) details are bound to be different for later models, such as the PB100, but I would imagine that (proportionally) less was integrated into later versions of the ROM.

Now why is that relevant? Well, I would want the whole OS in ROM. That way, if you goof up while creating patches, you simply reset the machine (or, better yet, disable patches while booting in order to recover your data). This calc of mine (with the OS in flash memory) has given me a scare a couple of times, and certain parts of its software do not appear to work correctly to this day. It is, of course, poorly documented so that is a problem too. Hopefully the ROM would be socketed, so that the OS could be upgraded (or the patches incorporated in some optimised form).* But that is not a huge issue. The other reason for a ROM based OS is to avoid the lengthly process of reinstalling the OS, as I'm certain many of you Windows users enjoy. ;-) The patches would have to be reinstalled, but your machine wouldn't be in an unusable form without them. If the patch installation system is sensible, they should be quite easy to copy from a floppy disk to a system folder anyway.

Byron.

[*] Come to think of it, wouldn't flash memory have a write enable line? If so, a manual switch or jumper on this line would be a suitable alternative.

Not exactly sure about that. They are used for onboard computers on
International Space Station currently being build :)

So using javac isn't real compilation either...? I'd say that it's real
compilation, just for a virtual machine.

> Perl also has separate compile and execute phases, although at present you
> have to do truly evil things to presuade it to spit out the byte-code.

:-)

> However, I think that that differentiation is bogus.

It definitely isn't a clear and /clean/ differentiation... and I did say
'roughly'. I don't expect to stick rigidly to that :-)

> It means that most implementations of Lisp are not programming languages.
> It means that if (god forbid!) you were to run C in an interpreter, it
> would not be a programming language.

Slight edit needed, I think: "is commonly separate" => "is or can be used as
a separate step"... and yes, I've seen a C interpreter...

Sometimes one's thoughts and what one types aren't always the same. Perhaps that is why your last sentence is nonsense. Many programs for 64K 8 bit computers were larger than 64K. Some 8 bit machines used bank switching, some used overlays, and some used both (WordPerfect for the 128K ProDOS Apple //e or //c would run MUCH faster if one added extra memory and formatted it as a disk drive, copied the files to the RAM disk and launched the program from the RAM disk. Neither ProDOS nor WordPerfect did any "bankswitching", only the loading of overlays from a disk.

> To get more memory requires
> the programmer to bank switch the program or to swap code

But then, the machine that you protest would cost too much would easily do that. As I recall the 128K Mac used "virtual memory". Was that the ability of the 68000, or the OS, or both? And why couldn't it be done on this machine inexpensively?

> The early
> PC's like the 286

The early PCs, of course, used 8088 and 8086 chips.
The second generation, "Advanced Technology" machines used their 286 and later 386 CPUs as fast 8088/86s.

> had all kinds of odd ball memory due to the

Of course, you have the same situation with the IIgs, because the 65816 has segmented memory.

> program.

No, it doesn't. It only requires RAM disk software. *IF* by special, you mean the ability to use a RAM disk as opposed to a floppy disk or hard disk. Again, overlays were VERY common in the late 70's and early 80's. Memory cost too much, so programers had to use disk space. Besides, you have shifted the point. You said the problem with his machine was very expensive additional hardware. Nothing about additional code.

> Not all Apple IIe programs supported the extra RAM

None of the above however deals with the erroneous conclusion that 64-256meg of RAM disk would require expensive additional hardware to use with a 68000 CPU.

I think I'd rather buy from auction something cool with my US$300,
like a used SGI workstation. So long as Winblows doesn't appear on
the monitor I'll be happy spending that on a used machine...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

In fact, 68000 had three signal lines (FC0, FC1, FC2) which AFAIK could, with some equilibristics, be used to make it address eight 16MB address spaces. I am not saying one should do so (to the contrary) but technically it might be done.

cu.

Oh, they are. The 80186 is also still rather popular (it pops up quite a lot in cheap disk controllers and the like, and consumer appliances - my fridge has one for no reason that I can fathom). Even the 6502 and Z80 are still being manufactured for use in embedded systems.

Bob Retelle <bobr1@provide.net>

: >I'm not subscribing to csa8bit to receive all those info I don't want to
: >read.

: Ignore it, it'll go away eventually.

I surely hope so...

: It actually DOES have relevance to the Atari 8-bit world,

Well, *some* msg's in the thread have a little bit Atari 8-bit related stuff in them. Unfortunately, many of them don't have any at all (notice all the crosspost info). The topic is now more about how much memory you can control with an 68xxx CPU, which has absolutely nothing to do with an 8-bit Atari...

: I get nostalgic every time I think about spending $550 for a floppy
: disk drive.

Time hasn't changed. The 1050 was state of the art in those days. About the same when you go out to buy a good DVD rewriter for the Wintels. Same price, same state of the art, and virtually no value when it's 15 years old. Some people will get nostalgic at the time it hasn't any value anymore, others may still use it, like I use my 1050 drive right now...

I don't get nostalgic when I use my Atari 130XE to program some things or what, or take a look at my BBS. This is cause my systems are used about every day or so. I get more nostalgic when joining an Atari 8-bit meeting, with a room full of 8-bitters that are actually used and not owned by people who keep them just for nostalgic reasons and use another computer to emulate the thing.

I don't say it's wrong to collect for nostalgic reasons or use an emulator. It's just that about every topic is about emulators and .ATR images, about how to convert them, how to format them, or how to build a "better" new computer, how to emulate this, how to emulate that, etc. What's wrong with the original Atari 8-bit hardware? Many people seem to forget there was a thing *before* the emulators, namely a real computer...

Don't get me wrong. I also have Pentiums laying around, and am using A.P.E. to transfer ATR images if I need to, but rather talk about the 8-bit side of the SIO2PC interface in stead of the other end of the cable...

My $0.02

says...

> If I cant use, or need to download beta driver/recompile the OS, etc... for any of my peripherial
^^^^^^^^^^^^^^^^^^^^^
> because the OS dont offer services/drivers I do see a problem using it for a mainstream home OS.
> Do you think linux is not on everyone computer because of marketing only?!?!?

Um, you're using XP... You're whole operating system IS beta.

Anyway, it's the hardware manufacturers job to provide drivers, not the OS. Any hardware worth having works in linux for the most part.

You don't NEED to recompile linux, some people do because they CAN, with linux you have that option. With windows you must upgrade or format and reload to implement new features. I didn't need to recompile linux to support ICS, but I did need a new copy of windows. I didn't need to reload linux to support fat32. but I did need to upgrade to rev-b95 windows. Same goes for USB, with windows you had to replace the whole OS to get that functionality. Firewire, ect, same thing there... you were saying?

And yes, the biggest reason people use windows is marketing, it comes with the computer. XP is nice, I'm using it right now (RC1 2505), but I wouldn't trust it to the extent I trust my Progeny Debian box. Heck I wouldn't even have it if it wern't for this MSDN subscription (another thing MS did right).

The only technical superiority Microsoft Windows has over Linux is the Gaming SDK/DirectX, which is incredibly good. No matter how much someone likes to bash M$, they still have to agree.

Your/My Win XP doesn't support 64bit, so again here comes an upgrade and/or format and reinstall. not on my Linux box! Rumor has it XP doesnt handle 64bit PCI very well either (was looking at that dual athlon board). In learned MS fashion, we "need a newer version"

It was a similar type of hardware in that it was produced in very low
volume and had no "standardized" parts in it, thus the individual
retail price was very high.

(Of course, in those days there really was little that could be called
"standardized", I admit.)

Most of the suggestions proposed here have been great from the "gee
whiz" neato aspect, but I really doubt they could be realized for the
target price, especially considering the overall sales are undoubtedly
going to be very small.

That would be great, of course. Those features don't seem to have
been very widely considered though, considering many of the
suggestions so far.

Well, Newark Electronics has the slower 20Mhz version of the 68020 for only about $65 each, but they only have 65 of them in stock.

I checked the 68020 and 68030 because those were suggested in several of the messages discussing Memory Management.

The 68000 requires an external MMU, taking up more real estate on the motherboard and adding cost to the basic cost of the CPU.

Having lived through the "OS in ROM" with the Atari ST, it can be a "double edged sword".   It WAS great to have the OS boot almost as fast as you could blink.

Unfortunately though, if there were any bugs in the code, (HA.. IF) you were stuck with them until the manufacturer could get around to first finding them, then fixing them, then finally producing a new version, then distributing them, then finally you get to open your machine and manually replace them.

With Atari, that manufacturing cycle took about as long as the useful life of the computer. It's far more difficult than releasing a "service pack" on disk.

And, the cost to the end user was ridiculous.

(Of course, it DID generate a nice little "cottage industry" for programmers to come up with fixes and patches while waiting for the "official" ROMS to finally appear.)

Do you really want "Mom and Pop" $300 computer buyers to have to be prying ROMs out of sockets and jamming new ones in?

Actually what I always thought Atari should have done with the ST was to put the OS on a cartridge. That way they could issue updates which could be swapped as easily as changing a game, and the old cartridges could be returned in the same shipping box for a credit. Sort of like deposit soda bottles.

Only problem is, it would add $$$ to the cost of the original unit.

(Cartridge shells, cartridge pc boards, sockets, bypass capacitors, possibly buffer chips, EPROMs, socket for the motherboard, tooling for the computer case, etc.)

When we would suggest improvements in the ST, Atari would whine about the cost. For example, sockets for the memory would have made RAM upgrades very simple, but they told us that would add $25 to the overall cost of the original computer, so sockets were out.

>
>Byron.
>

>so, a manual switch or jumper on this line would be a suitable alternative.

Yes, FLASH RAM would be workable, but... you'd also need a boot ROM with the read/write routines for the FLASH update in it. Otherwise, one hiccup and your computer's OS could be toast with no way to fix it. Just like blowing away a motherboard with the wrong BIOS upgrade. And of course, add the cost of the boot ROM and interfacing.

"LIM" is just the initials of the names of the companies that created
EMS, namely Lotus, Intel and Microsoft.

The reason is that Basic will being a good language for beginners isn't the best language to learn the art of programming (structure, modules etc..) . I'm not up to date up to date on recent Basic dialects but I believe the

same problem still applies. Once you get to the higher programming languages
this becomes evident and you have to 'unlearn' before you can start again.

Don't get me wrong. Basic was a good beginners language but these days I
think Python is far more suited for newbies and novices.

I forgot to mention that you would have to include labor and manufacturing
costs and the basic essentials (special casing (not just a standard box),
cooling, cables etc...). These things eat into margins.

Cheers,

Thomas van Kooten

Educational computer toy/tool then, that's a better sales argument than most
consoles offer these days.

But where does it load it's programs from then? No problem with a HD or we
could download everything thru the network interface...?

If it has a network interface you could use an external server for storage.
No need for floppy's, CD/DVD's then. You could register for this service at
the time of purchase. Maybe they could also include some open source
solution for people who want to run their own server at home.

That's simply projecting the current situation into the future (and the past for that matter).

As for a cheap games machine. Remember it ain't the cheap hardware that evaporates your bankaccount, it's the software. If we're good honest corporate citizens ;-)

> Anyone aiming to produce computers that retail at $300 is going to be

As seen from the current standpoint, I'm asking people to step from the straight and narrow to see if another perspective is possible.

Cheers,

Thomas van Kooten

What you're referring is an 'Uber-Console' given processor power, dedicated chips and proper emulators you could do that. But I'm afraid the $300 barrier would be broken if you include recent formats. For such a system to be legal (software piracy) a HD storage wouldn't be advisable. Instead it would have to support the various CD-formats, cartridge slots etc...straight out of the box.

It's possible i suppose but the price would be far above $300.

Cheers,

Thomas

>Weird. I think you should check out a recent Linux distribution.

I've been using and sysadminning Linux for the past few years, and none of the distributions I've tried have been sufficiently idiot-proof to put in a consumer device*. However, that doesn't mean that one couldn't be created.

Now that I've been using it for a couple of weeks, this 'ere Debian box behaves perfectly. I can and do use it as an appliance sometimes, and at other times - well, there's all the other goodies there so I can hack away.

I turn it on, and, after a minute or so, I'm at a graphical login. I log in and I have a desktop, with common applications already on the desktop and less-common applications in a small drop-down menu. The Gnome panel across the top has a clock, a battery meter, and a shutdown button, (and cos I'm somewhat more of a 'power user' than what we're targetting, it has virtual desktops, task lists, etc as well). It all 'just works'. And because the important config files are protected, dumb users can't just break it. I have to explicitly make myself root to break it.

* - nor is Windows. How many consumer devices do you have to go through umpteen arcane menus and options to do something trivial? Not even my VCR is as badly designed as Windows.

Touchy? No, just bored with your monotonous droning about nothing. You ask questions for which you already have answers. You antagonize for the sake of antagonism. You make outrageous statements and claims with nothing to back them up. You want to comment about my magazine, but you have never read a single issue. Your opinion means nothing to me, be it good or bad. You have no credibility. You're an asshole. My invitation still stands - feel free to take it and crawl back into your hole where you belong.

BBC micro, mode 0. 640x256 graphics, 80x32 text, monochrome. Very useable on
a PAL TV.

I've tested various distro's and for the moment Suse 7.2 comes close to your ideal. The graphical setup interface is top notch. You do need a decent system to run it though, but there are plenty of other distro's for lower end systems out there. The SuSE 7.2 evaluation can be completely run from CD-ROM with some settings and some memory swap space (not necassary if you +170MB RAM) stored on your HD. This distro really is plug and play. It can detect most of the components (sound, network, video, modem etc..) and set them up correctly. If your card isn't detected automatically you just select it from the list. (I had to select my old SB16 ISA card this way) and just fill in the settings for FM, MIDI, IRQ that sort of thing.

In the end you get a perfect configured Linux system thats idiot proof. No hassle, no danger of messing up your HD. Just boot the CD for a test run. Try downloading a version to see for yourself from www.suse.com

I've been experimenting with Linux for two years now and SuSE 7.2 (and Mandrake?) is the best idiot proof version I've seen. Anyone reading should try it, it's that good.

Cheers,

Thomas

Besides that, a computer without a ROM is just a dead hunk of silicon.
Fine, the CPU will work, the memory will work, but without a little peice of
code in ROM to tell it what to do at power on, where does it get the
instructions to deal with the network or hard drive?

Does this person think the hard drive just automatically squirts data into
the CPU without any instructions from the CPU whatsoever?

> same problem still applies.

No, it doesn't... As mentioned previously, BBC BASIC had procedure and
function definition... QL SUPERBASIC went one further and the

procedures/functions actually defined new keywords... It also had Repeat
loops and such. It was quite possible to dispense with GOTO altogether.
(And this was in 1983)

Hell, even C has GOTO... It's just that its use is frowned upon to the point
of flogging.
:)

Well, than you have never used a real good BASIC interpreter/compiler.
A lot of "old" Business BASIC versions are not much different than
more modern HLL. And even the BASIC used in machines like
Amstrad/Scneider or the good old BBC were a different ball game too.
Not to mention HP "Rocky Mountain BASIC" for technical apps....
Don't just think the crappy C64 basic or stuff like this... ;-)))

ok, but i also mentioned that in quantities you get probably prices
below what i mentioned from a general wholesales web site above.
>costs and the basic essentials (special casing (not just a standard box),
>cooling, cables etc...). These things eat into margins.
Well, not much cables in a modern computer, ok add another $2 and
maybe $5 for keyboard and mouse. As for materials to build it, you are
still way below $100.

There will be additional overhead, like labor, shipping and advertising, for which i would assume even more money than the actual labor to build it.

But the biggest catch would be to get the start with several million $ financed first, without knowing IF such a product would actually sell...
Well, i don't have that much money to gamble with, and if i would, i would rather lay somewhere the the tropical sun than writeing these lines ;-)))

Ralf

Actually I think it may already have been done. A group of scientists in India have developed the prototype for a $300 computer for the masses. Although recently a separate story proposed for India modern playstation 2 or Xbox as the basis for such a computer.
I think the current Shift magazine mentions the cheap computer prototype.
No idea what its features are.

I, not a company or else, can by a 700mhz AMD processor for 24$.
That doesn't seem 'far too expensive' to me. Those processor rocks!

> As OS? (Linux is a dead giveaway, but there also other OS's out there)

Linux, why not. .. oh yea. You mentioned userfriendly. so thats a nono.

> Build in programming language? (please choose anything but Basic!)

Built in? Are you think stuff like in the 70's? Or you really want to put a C++
compiler in rom?!?!?

> Amount of memory? (RAM and ROM)

256meg RAM. 8K EPROM

> Graphic and Sound?

Geforce2

Take a look at the XBox.

>
> Let's see what sort of systems people come up with.

Xbox.

Stephan

Personally I'd like to go for �400 to allow for inflation (my a1200 cost me �330 in 94'), but for the sake of arguement I'll stick to the 300.
OS: QNX other than NASA no body seems to have picked it up as a serous concern, so they maybe more acceptive as a partner in the project.
Proccessor: Probebly a Strong ARM or similiar, they seem very light weight and shouldn't cause over heating, either that or a Hitachi proccessor 1 step up from that of the dreamcast should be ok.
Graphics: I'll got out on limb here and say the ati128 as it is happy in both TV and monitor setups.
Sound etc: a cheap media proccessor, allows plenty of playing about by hobbyists so should be good enough.
Media/storage: some sort of CDrom and a 4 to 8 gig HD depending on whats cheapist.
Memorey: probebly ddr as its not that much more expensive than standard sdram and I'm not convinced that sdram will be around for much longer. Also allows better perfomance for the graphics and media.
ports: 4 usb, 1 network connection
Ideally you want all this on one mircoatx compatible board in a dvd/vcr style box, this way you can refit it in a tower case if you so wish.
keyboard and mouse.
no tv or monitor, buy your own you cheap skate I had to in 94' why should I give you one now :P

You people are insane.
for $300 you can get a high end pentium 3 system, loaded.
for $100 more you can get a high end 1.4gig system, loaded.
and these are retail prices! that doesn't include monitor, but who
cares?

get with the times.

I don't think so. Maybe for around $600 you could
do that. What world do you come from anyway. The
gigahertz processors cost over $1000 in the store in
a built system. The processor alone would cost a couple
hundred retail.

And where exactly can we get prices like that?

I dont think you can build a 1gig p3 system for 300$ even if you play with rebates and get alot of the compnant for near free.
Your best bet is with a 700mhz AMD. <300$ will get you the MB (100BT ethernet, 3d audio, 2d/3d 128bit video, usb, etc, etc..) <70$,
700mhz processor <25$, 10gig HD ~70$, 256meg PC133 <25$, case/250W & keyboard/mouse/speakers ~40$, floppy/CD would be
under 50$. So like 280$ in single quantity shopping online.
Contrary to people beleif its not hard for MS or Sony to build 300$ console and actualy make some money on that initiale sale.

I personaly think a 700mhz duron kick any other processor even half its price. How much for a 14mhz 68020ec?
You are probably better off running UAE on this sub 300$ system then on a basic a1200.

Stephan

The problem is with the apps and general UI system.
Dont know if its still the case, but getting to use an app,
was getting to know the programmer mind under unix for each and every app.
With OSX if you learn how to open a file in one app, great chances more then
that app will use that method.
I overhead people today in a store discovering why they PC with one click cd
burning
was not working... they put the original cd in the CDRW and the blank in the DVD
player.
Under linux it doesn't take much to have mass user be lost to the point that they
need
human assistance. Would you be ready so offer this support to millions ?

Having a user friendly OS is more then having a tweaked kernal on a CD.

This is simply Microsoft inspired FUD from someone who hasn't used a
modern Linux distro. Try SuSE 7.2 or Mandrake 8.0 before spewing more
of this propaganda.

Umm... go to www.pricewatch.com and click on "Processors - PC"

AMD 1Ghz Athlon CPU with 266 FSB are selling for as low as $81.

Complete 1Ghz Athlon SYSTEMs are selling for as low as $350

(Mid Twr, 20HD, 128 Mem, 50XCD, Floppy, Snd, 8MVideo, 56KModem,
2 USB, 120W Spk,KB/MS)

Like he said... it's the times...

Agreed.
Of course in another 20 years time emulating a Windows crash might be fun :)

Good DVD support? Easy to interface with 1394/DV products? Good set of USB drivers
for scanners/digital imaging? ... Easy to setup internet sharing? SSE/3dnow!
Optmized codecs?
Easy to use 'packet cd' support? How about Video IO, easy to setup & use?

If you tell me this stuff is handled better by the SuSE distribution then Windows
XP I will
probably switch my home OS to linux. But other wise I wont take an afternoon to
downgrade
my home OS.

If I cant use, or need to download beta driver/recompile the OS, etc... for any of
my peripherial
because the OS dont offer services/drivers I do see a problem using it for a
mainstream home OS.
Do you think linux is not on everyone computer because of marketing only?!?!?

Stephan

It is?  Compare and contrast the sales of those silly 'my first
computer' things, PC/Mac-based educational software, and even a
poor-selling console like the Dreamcast.

Until those newbies start wondering why their programs don't work, and it turns out to be because they typed the wrong number of spaces, or confused a tab for some spaces or vice versa.

Python is a rather nice language, but requires a newbie-unfriendly editor like emacs to keep the programmer sane.

How about Ruby?

Sad but true. One of the great strengths of X is that it does one job
- providing the ability to network graphical applications - and does
it well. Its great weakness is that it does nothing more than that
one job, and hence the proliferation of widget sets, window managers
and desktop environments leading to infinite variety and infinite
confusion.

>With OSX if you learn how to open a file in one app, great chances more then
>that app will use that method.

Pity that OS X is such utter pants in all sorts of other ways :-)

>I overhead people today in a store discovering why they PC with one click cd
burning
>was not working... they put the original cd in the CDRW and the blank in the DVD
player.

<sigh> it just ain't possible to design human stupidity out of the
system.

>Under linux it doesn't take much to have mass user be lost to the point that they need
>human assistance. Would you be ready so offer this support to millions ?

Me personally? No. I am insufficiently tolerant of idiots to do luser-support, and there is nothing to motivate me to create such a distribution right now. But if someone wanted to make a go at it, I could be persuaded to work on creating and maintaining the product. Provided he had a good business plan which would keep me in pay-cheques for a few years.

>Having a user friendly OS is more then having a tweaked kernal on a CD.

Which is why I talked about an entire distribution, not just a kernel. An appliance distribution is not going to look anything like a traditional Linux distro. Sure, the end result may be a nice Gnome desktop just like you can have with other distros, but the underlying system will be very different.

Hmmm ... I don't think that any of these groups are the right place
for advocating any particular Linux distribution over another. Some
of them are, of course, the right place to maintain that the Amstrad
roXX0rs and anyone who says otherwise is an inferior lifeform :-)

However, I'll come out from under my bridge, take a nibble from your
snack, and say that I don't think SuSE is suitable because of its
woeful package management and questionable security.

The package management is fine for the sort of people using Linux
nowadays, but is inadequate for use in an appliance. In this regard,
I feel Debian comes closest - but is even less appliance-like than

SuSE in many other areas.

[replies to the above three paragraphs will be cheerfully ignored, as I ain't interested in advocacy]

No distribution (yet) comes close to pleasing me wrt security*. In this sort of device, the biggest enemy is not an outside hacker (although they still need to be kept out) but the owner. He must be prevented from breaking his toy whilst still retaining the ability to use most of its functionality, including the ability to install software. The fact that this would break his ability to upgrade the system isn't that much of a problem. A boot-time option to either come up normally or to do an upgrade from the net would be sufficient. I have some fairly detailed ideas for how such a distribution could be put together, but I doubt most people here are interested in such arcana :-)

* - not even in terms of securing it as an ordinary Unix workstation, let alone as an appliance.

I don't know why people insist on calling languages like python and
perl 'script' languages.  Just because some people use them as that
does not mean that that is all they can do.  I have written some
rather large applications in perl, and colleagues have done the same
in python.  They are fully-fledged programming languages.

OK, Pentium III 1Ghz is $172.

A complete 1Ghz Pentium III SYSTEM is $418, same specs as above.

A far cry from $600, or   "over $1000".

Again, it's the times.

I wouldn't mind that kind of graphics, and that kind of text mode,
so long as the character sets are redefinable, and one of which
implements a conventional Commodore graphics character set (which
so many people seem to have memorized).

The scary part is that this would be trivial to do these days. If the self-initialization procedure of the Busmaster-DMA IDE controller simply included a "read one block from the disk into memory location 0" phase, you wouldn't really need any ROM. Just keep the CPU reset line active until the IDE controller is done. Not that I'd want such a system --- I don't like the idea of catastrophic hard drive failure in the first place, but this would give a whole new meaning to the term....

comp.sys.atari.advocacy:588 comp.sys.atari.st:14043 comp.sys.cbm:18314
comp.sys.sinclair:44936

Hardware:

- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution, high contrast, black and white is fine
- semi-portable design (something which can be moved while I'm working, but not something which I work on while moving)
- 64MB to 256MB RAM with battery backup, for storing documents. Or use flash memory if it is cheap enough.
- HD 3.5" floppy, for communicating with my other machines

Software:

- task switching. need not support running background processes, but I should be able to access other software while working
- mostly command driven, put pointer is also available (I'm viewing this from a programming standpoint. I don't want to waste time learning an event driven interface, along the lines of MacOS or Windows, for a "hobby machine")
- a default command set which resembles the more common unix utilities
- programming language must support graphical

output, using an easy to learn model (as most
versions of BASIC had, or PostScript)

- a machine language monitor, and an assembler
  should be provided by default.

These specifications are purely from the hobbies perspective.
I believe that this is something which I could put to productive
use, yet still learn the workings of (and program) with a decent
level of competence. It should also be easier to document than
the modern batch of PCs and Macs, which everybody appears to be
drooling over.

Who cares about getting with the times. I can't figure out what
to do with a 50MHz box, let alone a 1GHz one (let alone the 350MHz
one I'm on right now).

I would expect something like this to cost between $100 and $200.

Byron.

You couldn't get that much ram on a 68000 because it only
has a 24 bit memory bus. You would have to go to a 68030
or so to get the wider data path.

I have to agree.

Let's just limit it to installation. I've installed many versions of Linux over the years. Each one something of a challenge that would floor the average computer user.

OK, I admit that when I installed Mandrake 8.0 on a loaded Pentium III 800 it was a snap. It even recognized my Sound Blaster Live! and a Linksys NIC (Tulip) without any help on my part! But when I tried to install the same distro on a Pentium 100 -- same NIC and a Sound Blaster AWE32, it bombed miserably. I do have Red Hat 7.2 running on that machine, but it was hand-configuring all the way. It would be torture for anyone who was brought up on Windows.

Still, I wouldn't be discouraged about putting it into a $300 computer. Lets assume a high degree of uniformity in the hardware of such beasties. A distro of Linux, or any other OS could be designed to install easily in such a limited hardware environment and probably could be run and maintained just as easily.

I'd also have to say that users of such machines as Atari 8-bits would have the mindset to deal with any problems that came up.

Take care.

Alan

I felt as though I needed to throw in a bit on this subject.

You wouldn't have much choice on the CPU because the older the chip, the harder it is to get. Designing with the latest allows you to get production quantities with manageable lead times so inventory can be kept to a minimum. The older the chip, the more you have to buy at one time to assure you have it when it is in short supply or no longer available.
Also, you have to use larger memory blocks/chips for much the same reason as above. If you can design and build with the most demanded memory, it is cheaper to get but takes longer because of demand.
Compare the cost of 256 meg of: PC2400 DDR to PC133 EDO and you'll see what I mean.

Much has been said in this thread about why some one would design or buy such a computer rather than buy an intel type pc(PIII). IMHO, it is more a question of following the group and being a MS slave or trying something new and different. Perhaps even doing so while not filling bill gates pockets with even more money. I'd mention apple but MS has got its fingers in that pie too.

My old Atari (400 w/flat keyboard through an ST) were reasonably stable, fun to use, great learning tool (both for hardware hacking and software) and were ahead of their time(well not the ST<GRIN>)..

I'd gladly trade my Athlon based PC for a good, fast, up to date Atari type computer. But unless it had software that is "compatible" and up to date, it really is a "pipe dream".

I'll step off my soap box. That's for the chance to express my opinion(s)

: or so to get the wider data path.

Then throw in some sort of decoder for the 64-256MB chunk. Since it is not the main memory (that would be the 4MB chunk), it should not make much of a difference. Indeed, it need not make any difference to the average programmer, since it would (presumably) be access through a set of file system calls.

Besides, isn't the 6502 limited to 64kB chunks. Apple simply implemented some sort of paging mechanism to access the 128kB found in later models (IIe/IIc). Likewise for the 192kB card which I have lying around here, somewhere. (Though my understanding is the 1MB card for the 8-bit machines used some sort of window into memory.)

Byron.

Memory Management Unit which really extends the addressing
the processor has. To the programmer, it is as if you had 32 bit
addressing. You set the MMU chip to "bank" of RAM you
want and pass the rest of the address to memory bus. However,
you would then need to develop a MMU and the added cost
of R&D would increase your cost to build. It would be safer
to just move to a 68020 or 68030 processor and bypass the
smaller bus. I would think the chips are not much different
in cost these days as they have been around a long time.

Hey Chunk's!

USB 4 port Hubs can be had for $32 and floppies are less than $89...But
have not ued one in years..Nice try..

A Hades exceeds the $899 iMac and have not seen the tech advanced 040
box in mn yet..

Date: Wed, 06 Jun 2001 00:03:15 -0400

Hi James,

>The main problem of the tranquilizer is how it could be delivered to
>the basment of Tifkas parents house (aka the lair of the beast).
This should be handled with the outmost care and one should be very
cautious.. it not only seems to have parents that endure it, but now it
turns out that it even has neighbours with which it has at least some
kind of "friendly" relationship.
From this I can only conclude that it has the ability to adapt to its
environment... it has publicly stated attending several Mac shows, and

while doing so, it managed "somehow" to do this without attracting
any suspicion or/and attention to itself....

Cheers from Belgium
Dennis

The rest of the computer world uses the PDF standard.  Newsletters and
reports are done on PDF now.  Mac OSX has the PDF integrated were as
one can convert work into PDF with a click.  Don't you want your
readers to get ahead?  Makes me question the seriousness and
credibility of Atari Online News

A-ONE is not a newsletter or report. It has nothing to do with standards or getting ahead. TEXT is a format that anyone can use without the need to do anything to get it. Question all you want; you have no credibility and fortunately not someone to be taken seriously.

>> I wouldn't know - _I_ don't watch Fox News. My previous statement stands.

MAC OS has had PDF integrated for what? A month if that?
Some of us do read news and until Apple tosses classic mode from
OS 10 you should shut your yap...

No, three months to be precise...Every Mac has shipped with the PDF
reader called acrobat.  What does classic mode have to do with PDF?

ah, but you see The iDiot Forever Known As Sinclap can never shut up. It's simply incapable of it, since its sad obsession with attacking all Atari users because of some silly slight in the past won't let go of his brain.

Personally TiFKAS' proclamations have always been sources of hilarity. Remember "Pointcast will destroy Atari presence on the 'Net?" It was Pointcast instead that crashed and burned. Remember "Dejanews is the future, all newsreader programs are obsolete?". Dejanews is now a shell of its former self, and newsreader programs on all platforms are still being developed and upgraded, and TiFKAS has been forced to use a newsreader program itself. Remember last year in .advocacy when it proclaimed "all ATI video cards are crap?" . It sure began using the crowbar to extricate its foot from its mouth after Particle Salad mentioned to it that ATI cards are found in most Macs including the iMac (and it claims that someone hired it to be an "Apple Power Rep!").

Oh, and of course - "If Steve Jobs ever came back to Apple, he would destroy the company. He is an arrogant bonehead." A message that still haunts TiFKAS to this day, even to the point of its denying that it ever said it while simultaneously licking Steve's boots....

3 months, geesh impressive. The truth is mac os got a complete
over haul and finally after several years catches up to MiNT.
If it was so great why replace it entirely... you are pathetic
and blind. If you knew anyting you'd know that there is a
PDF viewer for the Atari... not a great one but it works.

Pointcast was a nice idea in it's time..But MacTicker fits the bill
nicely and a site that has the most comprehensive news web site links
is the drudgereport.com.

ATI cards at the time were crap. But the Radeon card is nice and the
Rage mobility cards found in laptops such as the iBook fit the bill

nicely. ATI has come along way. But work is needed now that NVIDIA is at there heels.

So what is A-ONE? If its not a newsletter or report...is it toilet
paper? Most of the content in the toilet paper is old news and have
been reported elsewere. Why do you miss use the Atari name when
greater than 90% is non Atari related?

Most computers(Mac/Win) ship with the Adobe PDF reader.  So what is the
problem?  Your box is not compatible?  Sounds like sour grapes..

> About the only portable document format worthy of this attribute appears

PDF is here.. Email apps will incorporate with the recipient recieveing
an open PDF in the email..Sounds like progress..But you would not know
since your stuck in 16 bits..

There you go with the miss-information again... it's 32-bit.

So where do you add peripherals on your beloved imac, assuming you have any. For that matter where do you save files? those imac hard drives are adequate but not infinate. When its full where do you files go? in the bit bucket with the rest of your mindless drivel.

>
> A Hades exceeds the $899 iMac and have not seen the tech advanced 040
> box in mn yet..

If you'd bothered venturing out of your parents basement in the past 5 years you'd have seen one by now, both the Imac and the Hades have been available for a few years. Fact is I was able to find a Hades before I could find an iMac. But leaving your parents basement might expose you to something that terriefies you beyond imagining, something those of us in the real world call FACTS.

I don't have to. You are doing a good job of that. The only "good job" you've done in your life. The laughable seriousness you accord yourself only makes your pathetic antics all the more funny to those of us who live in the real world.

A more likely scenario is they'd be relieved at the removal of such an
unstable induvidual. I for one wouldn't let children play outside with
such noxious induvidual lurking about.

> From this I can only conclude that it has the ability to adapt to its

Claimed to attend shows. Truth is nobody has seen IT at any show this or
any other year. IT's total lack of any factual statements points in this
direction. People who do attend mac shows report events which concistantly
disprove IT's diatribes on a regular basis are an undeniable proof.

He always goes with the miss-information. I had this conversation
before, Reading a PDF files on the Hades is a snap because I have
Ghostscript. Nice program....

Oh sure...-)  Not like 75,000 mac heads would know all of each other.
Was at the keynote, like 15 rows from the stage when the TBook was
beeing unveiled.

No, but Iowa is.. Thats why I used the word 'currently'..Does have a
meaning. Currently in China..

Guess we down south had to improve on the english language.

A free country, unless up north is not. I could not care what people
use..

How did Mac evangilism get into this? What makes you think I am a Mac
fanactic? I use one as a tool to get the job done.. You're being to
emotional ..

>Than read your own rag to see.

You're all talk. You make false statements and when asked to put your money where your mouth is, you choke on it. I know the content of the magazine - you obviously do not.

>> <sigh> You are such an idiot.
>
>And you for wasting bandwith..

It's mine to waste.

>Even Maccentral can send staff to trade shows, why not you?

I already answered you. When you pay me and my staff at least what we all get paid now in our "real" jobs, I'll send people to the shows. Otherwise, who do you think is going to pay for these trips? The work we do at A-ONE is done as volunteers, because we enjoy it.

Not at all. As I've repeatedly said, I rely on verifiable FACT not you're
unproveable bollocks.

> Called weeding files when not needed. Since you want to know, have a
> VST external HD for backups.
>

Try answering the question instead of avoiding it. Btw, how do you do backups?
an
external hd is useless for this. Removable and Writeable media is a MUST in any
computer. and NO a cd-rw doesn't fill this requirement, RW mode cd's are only
useable about 10 writes then its no longer usable.

> ROTFLMAO! How come I can't find a Hades down south?

Because you haven't looked!!! I get a lot of laughter from your moronic comments.
FACT is I got a chance to use one at the local user group befre the Imac hit town.
No doubts, no crap, just unadulterated fact. No matter how long you keep that
paper
bag over your head (better for us not to see you) you can't make the hades go away
by hiding in your parents basement the rest of your life.

Hiya Gerrit
I hope you have the good fortune to find one of those rare STbooks.
Many including myself would love to have one as well. In my years of
being an atari nut I've only seen a single example in a dealer when they
were new. I remember it sitting next to a TT030 and having an identical
price.

So why did you previously state china was 300 milse south of your "womewhere in MN".   you know sinCRAP I've been reading your drivel for a while and the more you mouth and spew lies the more you dig yourself into a hole. You lie to cover your layers of lies. Many people have pointed this out to you, yet you're the only one totally oblivious to this glaring fact. Yet you still try to bullshit your way through life. Theres no way this can work, ask Bill Palmer and the other residents of the Net.Kook archives.

It was obvious that China is not down south..Thats why the word
'currently' was used as currently in China...

Not might fault you were too densed...

My critics are a dime and dozen...

   what's even more pathetic - not only does The iDiot Forever Known As
Sinclap claims that it is a college graduate - which, if this is an
example of what American colleges put out, then the USA is doomed - but
also claims to be an "Apple Power Rep", which is highly unlikely due to
the fact that real "Apple Power Reps" (yes, I have spoken to real ones
at Macworld Expo NY) require a high level of reading and writing
comprehension as a term of employment. TiFKAS is still refusing to
divulge who employs it (muttering twaddle about "Atari Jihads" who are
"out to get it").

years ago TiFKAS would defend its constant attacking of Atari users in c.s.a.st (which was in violation of the newsgroup charter, which forbid "computer vs. computer" debates) by wrapping itself in the American flag and claiming that it was protected under the First Amendment of the US Constitution, which promises freedom of speech. When, however, I discovered that the US Supreme Court had ruled in 1974 (in the landmark case "FCC Vs. Pacifica" AKA "Pacifica Broadcasting's playing George Carlin's Seven Words You Must Never Say On Television") that public nuisances were not protected under the 1st Amendment and could indeed be subject to criminal and libel prosecution, and made that clear in that forum that TiFKAS defined "public nuisance" to a T, TiFKAS promptly shut up.

I find it interesting that TiFKAS is accusing you of being from Canada, Hallvard (notice the "up North" reference) -its known emnity to the Great White North is showing, due to the fact that a number of its most vocal critics who have totally humiliated it in exposing its vast ignorance of anything computer-related hail from there, often claiming we have a lousy "socialist government", are sinking economically, and are nothing more than "US-owned territory". It must really hurt it to discover that currently Canadian economic growth is larger than the US, not to mention that at least in our elections we can count, unlike in TiFKAS' US where they allowed the dumbest politician since Dan Quayle to become president due to a stupid concept like the Electoral College. (It's also funny that the newspaper it uses as "evidence" of the bad stuff about Canada, The National Post, is also considered a national joke which has bled red ink since its inception, and that its publisher, Conrad "Tubby" Black, has fled Canada with his tail between his legs out of shame).

ROTFLMAO! well said, Hallvard!

TiFKAS is now denying that it is a "Mac Evangelist"? After all these years of carpet-bombing c.s.a.st and .advocacy with its obvious pro-Mac drivel? After calling users of fuji-badged computers "Atari boobs" who "need to get laid"? After saying such things like "Calamus is crap", and "90% of all Atari applications fall over on the Milan"? Who once claimed that Apple, depite a BILLION DOLLAR LOSS in 1997, still showed a profit?
>
>
> >sinclap!

> Can't stand behind your worthless drivel, can you?

its name: Peter Sinclair (sometimes Peter Sinclair-Day)
its ISP - Earthlink (check the headers, that's where it's posting from)

> Makes me wonder how many Internet providers you've been banned from....
> I'm sure this isn't the only newsgroup you've been polluting with your
> endless stream of crap.

TiFKAS has also been known to spread its reign of error in the amiga groups, as well as the Lynx and Jaguar groups.

TiFKAS has also been reprimanded by Cedarnet.org for violating its user agreement when it was active in attacking users in c.s.a.st (a charge it denies, despite the fact that I was e-mailed by Cedarnet and was told that it had been warned and reprimanded, subsequently TiFKAS disappeared from c.s.a.st for a time like a whipped puppy), was tossed off DejaNews for a time for posting sexually explicit content in .advocacy, and was banned from Hotmail after it used the service to send harrassing e-mail to one of its critics.

If that's the best you can do, your 'insults' are about as creative as your
arguments..

Get a life, MacParrot.

I say again, have a portable VST HD to back up files that I want
preserved. Ext HD is useful for my needs.

My parents damp basement is 300 miles from my place. Currently in
China for a working excursion..

Everybody thinks they have a lilfe and a sense of humor.

Your time spent here displays the clear and obvious fact: you have no life.

You're not only the MacParrot, you're actually parroting me.. way to go, prove my point. Come up with your own insults or don't even try, MacParrot.
